Introduction

Edupoint Synergy is a web-based solution that delivers Student Information System (SIS) features. Synergy is Schools Interoperability Framework (SIF) compliant and SIF-certified. Synergy delivers features and compliance reporting capabilities through a flexible, customizable architecture that:

- Streamlines workflow
- Supports data-driven decision making
- Facilitates collaborative communications

Synergy tracks and manages all essential district and student data while streamlining all essential K-12 student information management processes.

The LoadMaster can be used to load balance the Edupoint Synergy workload. The LoadMaster offers advanced Layer 4 and Layer 7 server load balancing, content switching, SSL Acceleration and a multitude of other advanced Application Delivery and Optimization (ADC) features. The LoadMaster intelligently and efficiently distributes user traffic among application servers so that users get the best experience possible.

2

Configuring the LoadMaster

Two Virtual Services are needed to load balance the Edupoint Synergy workload. This Virtual Services can be configured manually, or a template can be used to quickly and easily configure the Virtual Services with the recommended settings. Refer to the relevant section below to find out how to create the Virtual Services.

Contents

- Create the Virtual Services using a Template
- Modify the Redirector Virtual Service
- Create the Virtual Service

Create the Virtual Services using a Template

Progress Kemp has developed a template containing the recommended settings for Edupoint Synergy. This template can be installed on the LoadMaster and can be used when creating each the Virtual Services. Using a template automatically populates the settings in the Virtual Services. This is quicker and easier than manually configuring each Virtual Service. If needed, you can make changes to any of the Virtual Service settings after using the templates.

Released templates can be downloaded from the Progress Kemp website: Templates.

For more information and steps on how to import and use templates, refer to the Virtual Services and Templates, Feature Description.

Note: If you create another Virtual Service using the same template, ensure to change the **Service Name** to

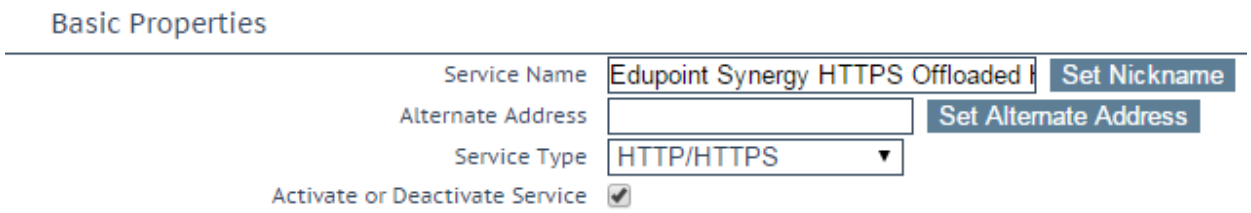
a unique name.

Modify the Redirector Virtual Service

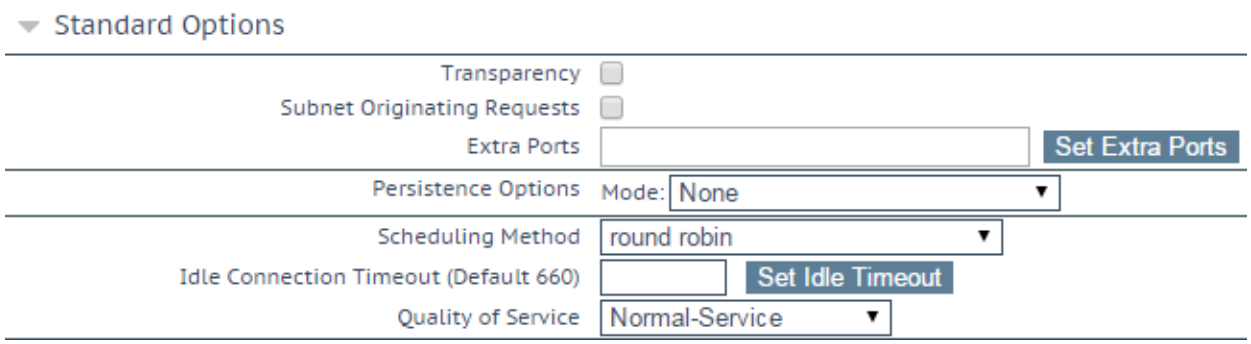
When **Add HTTP Redirector** is clicked, a redirector Virtual Service is automatically created. To configure this Virtual Service, follow the steps below:

1. In the main menu, select **Virtual Services > View/Modify Services**.

2. Click **Modify** on the redirect Virtual Service.



3. Enter a recognizable **Service Name**, for example **Edupoint Synergy HTTPS Offloaded HTTP Redirection**.

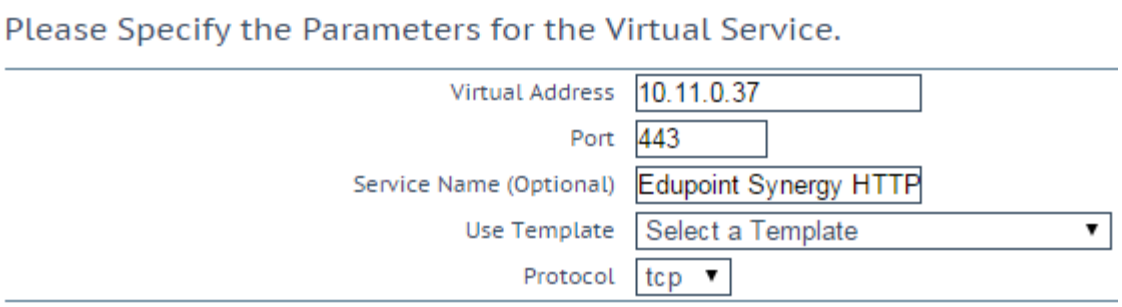


4. Select **None** as the **Persistence Mode**.

Create the Virtual Service

To manually configure the Virtual Services, follow the steps below in the LoadMaster Web User Interface (WUI):

1. In the main menu, select **Virtual Services > Add New**.



2. Enter a valid **Virtual Address**.
3. Enter **443** as the **Port**.
4. Enter a recognizable Service Name, for example **Edupoint Synergy HTTPS Offloaded**.
5. Click **Add this Virtual Service**.
6. Configure the settings as recommended in the following table:

Section	Option	Value	Comment
SSL Properties	SSL Acceleration	Enabled	
	Reencrypt	Enabled	
Standard Options	Persistence Mode	Active Cookie	
	Timeout	1 Hour	
	Cookie Name	LM_Synergy	Click **Set Cookie**.
Advanced Properties	Add HTTP Headers	None	Click **Add HTTP Redirector**.

7. Add any Real Servers as needed.
