- Overview of Progress Corticon

Progress Corticon documentation

The following documentation, as well as a *What's New in Corticon* document, is included with this Progress Corticon release:

Corticon Tutorials		
Corticon Studio Tutorial: Basic Rule Modeling	Introduces modeling, analyzing, and testing rules and decisions in Corticon Studio. Recommended for evaluators and users getting started. See also the PowerPoint-as-PDF version of this document that is accessed from the Studio for Analysts' Help menu.	
Corticon Studio Tutorial: Advanced Rule Modeling	Provides a deeper look into Corticon Studio's capabilities by defining and testing vocabularies, scope, collections, messages, filters, conditions, transient data, and calculations in multiple rulesheets that are assembled into a Ruleflow. See also the PowerPoint-as-PDF version of this document that is accessed from the Studio for Analysts' Help menu.	
Corticon Tutorial: Using Enterprise Data Connector (EDC)	Introduces Corticon's direct database access with a detailed walkthrough from development in Studio to deployment on Server. Uses Microsoft SQL Server to demonstrate database read-only and read-update functions.	

Corticon Studio Documentation: Defining and Modeling Business Rules			
Corticon Studio: Installation Guide	Step-by-step procedures for installing Corticon Studio and Corticon Studio for Analysts on computers running Microsoft Windows. Also shows how use other supported Eclipse installations for integrated development. Shows how to enable internationalization on Windows.		
Corticon Studio: Rule Modeling Guide	Presents the concepts and purposes the Corticon Vocabulary, then shows how to work with it in Rulesheets by using scope, filters, conditions, collections, and calculations. Discusses chaining, looping, dependencies, filters and preconditions in rules. Presents the Enterprise Data Connector from a rules viewpoint, and then shows how database queries work. Provides information on versioning, natural language, reporting, and localizing. Provides troubleshooting and many <i>Test Yourself</i> exercises.		
Corticon Studio: Quick Reference Guide	Reference guide to the Corticon Studio user interface and its mechanics, including descriptions of all menu options, buttons, and actions.		
Corticon Studio: Rule Language Guide	Reference information for all operators available in the Corticon Studio Vocabulary. A Rulesheet example is provided for many of the operators. Includes special syntax issues, handling arithmetic and character precedence issues.		
Corticon Studio: Extensions Guide	Detailed technical information about the Corticon extension framework for extended operators and service call-outs. Describes several types of operator extensions, and how to create a custom extension plug-in.		
Corticon Server Docum	entation: Deploying Rules as Decision Services		
Corticon Server: Deploying Web Services with Java	Details installing the Corticon Server as a Web Services Server, and then deploying and exposing Decision Services as Web Services on Tomcat and other Java-based servers. Presents the features and functions of the browser-based Server Console.		
Corticon Server: Deploying Web Services with .NET	Details installing the Corticon Server as a Web Services Server, and then deploying and exposing decisions as Web Services with .NET. Provides installation and configuration information for the .NET Framework and Internet Information Services (IIS) on various supported Windows platforms.		
Corticon Server: Integration & Deployment Guide	An in-depth, technical description of Corticon Server deployment methods, including preparation and deployment of Decision Services and Service Contracts through the Deployment Console tool. Discusses relational database concepts and implementation of the Enterprise Data Connector. Goes deep into the server to discuss state, persistence, and invocations by version or effective date. Includes samples, server monitoring techniques, and recommendations for performance tuning.		

Overview of Progress Corticon

Progress® Corticon® is the Business Rules Management System with the patented "no-coding" rules engine that automates sophisticated decision processes.

Progress Corticon products

Progress Corticon distinguishes its development toolsets from its server deployment environments.

- Corticon Studios are the Windows-based development environment for creating and testing business rules:
 - Corticon Studio for Analysts. is a standalone application, a lightweight installation that focuses exclusively on Corticon.
 - Corticon Studio is the Corticon Designer perspective in the Progress Developer Studio
 (PDS), an industry-standard Eclipse and Java development environment. The PDS enables
 development of applications integrated with other products, such as Progress OpenEdge.

The functionality of the two Studios is virtually identical, and the documentation is appropriate to either product. Documentation of features that are only in the *Corticon Designer* (such as on integrated application development and Java compilation) will note that requirement. Refer to the *Corticon Studio: Installation Guide* to access, prepare, and install each of the Corticon Studio packages.

Studio Licensing - Corticon embeds a time-delimited evaluation license that enables development of both rule modeling and Enterprise Data Connector (EDC) projects, as well as testing of the projects in an embedded Axis test server. You must obtain studio development licenses from your Progress representative.

- Corticon Servers implement web services for business rules defined in Corticon Studios:
 - Corticon Server for deploying web services with Java is supported on various application servers, and client web browsers. After installation on a supported Windows platform, that server installation's deployment artifacts can be redeployed on various UNIX and Linux web service platforms as Corticon Decision Services. The guide Corticon Server: Deploying web services with Java provides details on the full set of platforms and web service software that it supports, as well as installation instructions in a tutorial format for typical usage.
 - Corticon Server for deploying web services with .NET facilitates deployment of Corticon
 Decision Services on Windows .NET Framework and Microsoft Internet Information Services
 (IIS). The guide Corticon Server: Deploying web services with .NET provides details on the
 platforms and web service software that it supports, as well as installation instructions in a
 tutorial format for typical usage.

Server Licensing - Corticon embeds a time-delimited evaluation license that enables evaluation and testing of rule modeling projects on supported platform configurations. You must obtain server deployment licenses and server licenses that enable the Enterprise Data Connector (EDC) from your Progress representative.

1

Introduction to Corticon Rule Language

Graphical modeling languages and tools (UML, ER, ORM, for example) are not sufficiently precise for specifications. Additional constraints on the objects in the model must also be defined. While natural languages are easily used by individuals without a programming background, they are often ambiguous. On the other hand, formal programming languages are precise, but not easily used by business analysts and other non-programmers.

The Corticon Rule Language has been developed to resolve this dilemma. Based on the Object Constraint Language (OCL, an extension of the Universal Modeling Language specification 1.1), the *Corticon Rule Language* (CRL) is designed to enable non-programmers to express rules clearly and precisely without the use of procedural programming languages. More information on OCL may be found at www.uml.org.

For details, see the following topics:

- Rule structure
- Basic data types
- Truth values
- Collection operators
- Language operators
- Vocabulary used in this Language Guide

Rule structure

In traditional programming languages (or logic systems), most rules are expressed via IF/THEN structures. The IF clause contains a conditional expression and the THEN clause contains actions the rule should perform if all conditions have been met. This IF/THEN structure is expressed as Conditions and Actions in the Rulesheet user interface of Corticon Studio. For more information on building and organizing rules in Corticon Studio, see the Corticon Studio Tutorial: Basic Rule Modeling.

Basic data types

The proper expression and execution of rules in Corticon Studio is dependent on the type of data involved. Each attribute in the Corticon Studio Business Vocabulary has a data type, meaning that it has restrictions on the type of data it may contain. Corticon standard data types as listed and described in the following table:

Data Type	Description
String	Any combination of alphanumeric characters, of any length
Integer	A whole number, including zero and negative numbers, of any length
Decimal	A number containing a decimal point, including zero and negative numbers, of any length
Boolean	Values are true and false. T and F may also be used.
DateTime	Values must be entered for both date and time.
Date	A value with only date information. No Time information is allowed.
Time	Value with only time information. No Date information is allowed.

In this guide, the data types Integer and Decimal are often referred to by the generic term < Number>. Wherever < Number> is used, either Integer or Decimal data types may be used.

Syntax such as <DateTime> indicates that data must conform to the data type shown in angle brackets (<...>). For this example, you might enter 9/13/2013 2:00:00 PM EST. Do not type the angle brackets themselves.

See DateTime data type on page 195 for further details on formatting DateTime, Date, and Time information.

Truth values

This guide uses the notation <Expression> to refer to some combination of terms from the Vocabulary that resolves or evaluates to a single "truth value". A truth value is the Boolean value (true or false) assigned to an expression upon evaluation by the rule engine. For example, the expression Patient.name='John' has a truth value of true whenever the patient's name is John. If it is not John, then the truth value of this expression is false.

Collection operators

Many of the operators provided in the Corticon Rule Language deal exclusively with collections of entities. When using collection operators, the expression **must** use aliases to represent the collection(s) operated on by the collection operator(s). A complete discussion of aliases is included in the *Rule Modeling Guide*. Reminders are included throughout this manual wherever collection operators are referenced.

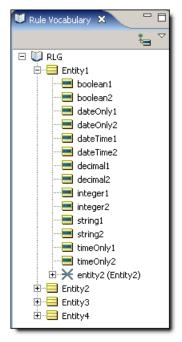

Language operators

The Corticon Rule Language operators can be grouped into various classifications as shown in the following tables. Each operator is subsequently described in detail in the Language Reference section of this document. This section includes a detailed description of the operator, its syntax, usage restrictions, and an example in a Corticon Rulesheet.

Vocabulary used in this Language Guide

This guide uses a generic Vocabulary in all its examples. The Vocabulary contains four entities, each of which contains the same attribute names and types. Attribute names reflect their data types. For example, <code>integer1</code> has a data type of Integer. This generic Vocabulary provides sufficient flexibility to create examples using all operators and functions in the Corticon Rule Language. <code>Entity1</code> is shown expanded in the following figure:

Figure 1: Vocabulary used in Corticon Language Guide examples

2

Rule operators

This chapter describes the toolset for accessing and using operators. For details, see the following topics:

- Icons
- Tool tips
- Usage restrictions

Icons

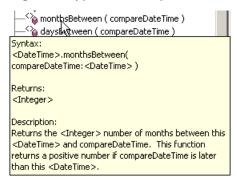

Rule Operators are assigned icons which provide the user with information about their usage. The following table describes these icons:

Icon	Where Found	Purpose	Examples
≡•	General, Literals category	indicates special values or constants	null, true, other
< >₀	General, Functions category	indicates system values that are automatically retrieved upon rule execution.	now, today
_	Operators, Boolean category	this special "unary" operator icon is used only with not	not
<>```	Operators, all categories	indicates the operator uses a period "." to attach to its operand. Most operators with this icon typically fell into the previous "function" category.	day, round, contains
•	Operators, all categories	indicates the operator is used between two operands. Most operators with this icon typically fell into the previous "comparison" category.	equals, multiply
→	Operators, Collection & Sequence categories	indicates the operator is used with collections or sequences. Also indicates an alias must be used to represent the collection operated on.	sum, size
×	Extended Operators	indicates the operator has been added to the Vocabulary using the extension framework described in Corticon Extensions Guide.	-

Tool tips

In Corticon Studio, moving the mouse over a Vocabulary operator and pausing, or "hovering" for a moment, will cause a dynamic "tool tip" text box to display. This tool tip contains information about operator syntax, return data type, and description, all of which are supplied in more detail in this Guide. For questions not answered by the tool tip, refer to the detailed operator descriptions in this Guide. The following figure shows a typical tool tip for the date operator .monthsBetween:

Figure 2: Typical Rule Operator Tool Tip

Usage restrictions

The following illustrations show the general usage restrictions for the various types of Vocabulary terms depending on where they are used in a Rulesheet. This table indicates, for example, that entities (terms from the Vocabulary) may be used in any section of the Rulesheet. Rule Operators, however, are restricted to only three sections.

Note: Some operators have specific restrictions that vary from this general table – see each operator's usage restrictions for details of these exceptions.

Figure 3: Vocabulary usage restrictions in Rulesheet sections

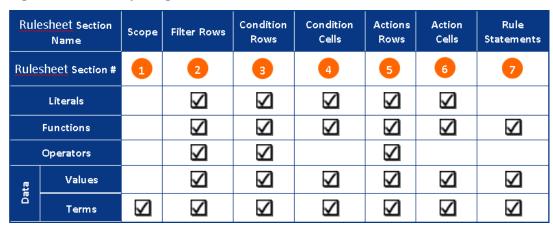

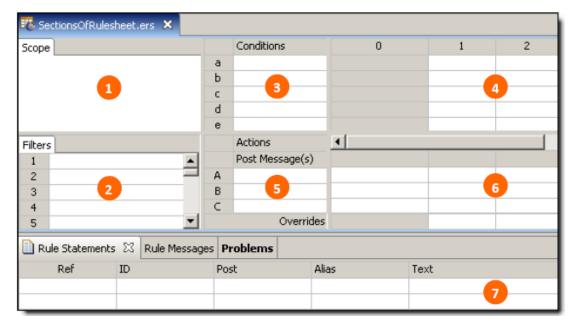

Figure 4: Sections of Rulesheet that correlate with usage restrictions

Categories of rule operators

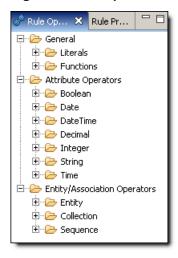

Corticon Studio presents its rule operators in logical groups. For details, see the following topics:

- Organization
- General terms
- Attribute operators
- Entity/Association operators
- Extended Operators

Organization

Rule Operators are classified based on the data type(s) of the terms to which the operator may be applied (known as the "operand"), as shown:

Figure 5: Rule Operator categories

General terms

Corticon's **General** operators are categorized as **Literals** and **Functions**.

Literals

Literal Terms can be used in any section of the Rulesheet, except **Scope** and **Rule Statements**. Exceptions to this general statement exist – see individual literals for detailed usage restrictions.

Corticon's **Literals** operators are as follows:

Name and Syntax	Returns	Description
Null		
null	none	The null value corresponds to one of three different scenarios:
		the absence of an attribute in a Ruletest scenario
		the absence of data for an attribute in a Ruletest scenario
		an object that has a value of null
True	•	•

Name and Syntax	Returns	Description		
true Of T	Boolean	Represents Boolean value true		
False				
false or F	Boolean	Represents the Boolean value false		
Other				
other	any	When included in a condition's Values set, other represents any value not explicitly included in the set, including null.		
CellValue				
cellValue	any	cellValue is a variable whose value is determined by the rule Column that executes		

Functions

Corticon's Functions operators are as follows:

Name and Syntax	Returns	Description	
Now			
now	Date	Returns the current system date and time when the rule is executed.	
Today			
today	Date	Returns the current system date when the rule is executed.	

Attribute operators

The Corticon Rule Language supports attribute operators categorized as Boolean, DateTime, Date, Time, Decimal, Integer, and String.

Boolean

Corticon's **Boolean** attribute operators are as follows:

Name and Syntax	Returns	Description	
Equals (used as a comparison)			
<expression1> = <expression2></expression2></expression1>	Boolean	Returns a value of true if <expression1> has the same value as <expression2>.</expression2></expression1>	
Equals (used as an assignment)			
<boolean1> = <expression1></expression1></boolean1>	Boolean	Assigns the truth value of <expression1> to <boolean1></boolean1></expression1>	
Not Equal To	,		
<expression1><><expression2></expression2></expression1>	Boolean	Returns a value of true if <expression1> does not have the same truth value as <expression2></expression2></expression1>	
Or			
<pre><expression1> or <expression2> or</expression2></expression1></pre>	Boolean	Returns a value of true if either <pre><expression1> or <expression2> evaluates to true.</expression2></expression1></pre>	
And	,		
< <boolean1> and <boolean2></boolean2></boolean1>	Boolean	Returns a value of true if both < <boolean1> and <boolean2 are="" be="" can="" filters="" in="" note:="" of="" only="" operator="" preconditions="" rulesheet.<="" section="" td="" the="" this="" true.="" used=""></boolean2></boolean1>	
Not			
not <expression></expression>	Boolean	Returns the negation of the truth value of <pre><expression></expression></pre>	

DateTime

Note: A DateTime data type **must contain both** date information **and** time information. Applying a DateTime operator to a DateTime attribute should always produce a result. Be sure to use the data type that suits your needs.

Corticon's **DateTime** attribute operators are as follows:

Name and Syntax	Returns	Description	
Equals (used as a comparison)			
<pre><datetime1> = <datetime2></datetime2></datetime1></pre>	Boolean	Returns a value of true if <datetime1> is the same as <datetime2>, including both the Date and the Time portions</datetime2></datetime1>	
Equals (used as an assignment)			
<pre><datetime1> = <datetime2></datetime2></datetime1></pre>	DateTime	Assigns the value of <datetime2> to <datetime1></datetime1></datetime2>	
Not Equal To	•		
<pre><datetime1> <> <datetime2></datetime2></datetime1></pre>	Boolean	Returns a value of true if <datetime1> does not equal <datetime2></datetime2></datetime1>	
Less than	•		
<pre><datetime1> < <datetime2></datetime2></datetime1></pre>	Boolean	Returns a value of true if <date1> is less than <date2></date2></date1>	
Greater than			
<pre><datetime1> > <datetime2></datetime2></datetime1></pre>	Boolean	Returns a value of true if <datetime1> is greater than or equal to <datetime2></datetime2></datetime1>	
Less than or Equal to	•		
<pre><datetime1> <= <datetime2></datetime2></datetime1></pre>	Boolean	Returns a value of true if <datetime1> is less than or equal to <datetime2></datetime2></datetime1>	
Greater than or Equal to			
<pre><datetime1> >= <datetime2></datetime2></datetime1></pre>	Boolean	Returns a value of true if <datetime1> is greater than or equal to <datetime2></datetime2></datetime1>	
Year	•		
<pre><datetime>.year</datetime></pre>	Integer	Returns the century/year portion of <pre><datetime> as a four digit Integer</datetime></pre>	
Month			
<pre><datetime>.month</datetime></pre>	Integer	Returns the month in <datetime> as an Integer between 1 and 12</datetime>	
Day			
<datetime>.day</datetime>	Integer	Returns the day portion of <datetime> as an Integer between 1 and 31</datetime>	

Name and Syntax	Returns	Description	
Hour			
<pre><datetime>.hour</datetime></pre>	Integer	Returns the hour portion of <datetime>. The returned value is based on a 24-hour clock.</datetime>	
Minute			
<pre><datetime>.min</datetime></pre>	Integer	Returns the minute portion of <datetime> as an Integer between 0 and 59</datetime>	
Second			
<pre><datetime>.Sec</datetime></pre>	Integer	Returns the seconds portion of <datetime> as an Integer between 0 and 59</datetime>	
Add years			
<pre><datetime>.addYears (<integer>)</integer></datetime></pre>	Date	Adds the number of years in <integer> to the number of years in <datetime></datetime></integer>	
Add months			
<pre><datetime> .addMonths (<integer>)</integer></datetime></pre>	Date	Adds the number of months in <integer> to the number of months in <datetime></datetime></integer>	
Add days		•	
<pre><datetime> .addDays (<integer>)</integer></datetime></pre>	Date	Adds the number of days in <integer> to the number of days in <datetime></datetime></integer>	
Add hours			
<pre><datetime> .addHours (<integer>)</integer></datetime></pre>	Date	Adds the number of hours in <integer> to the number of hours in the Time portion of <datetime></datetime></integer>	
Add minutes	Add minutes		
<pre><datetime> .addMinutes (<integer>)</integer></datetime></pre>	Date	Adds the number of minutes in <integer> to the number of minutes in the Time portion of <datetime></datetime></integer>	
Add seconds			
<pre><datetime> .addSeconds (<integer>)</integer></datetime></pre>	Date	Adds the number of seconds in <integer> to the number of seconds in the Time portion of <datetime></datetime></integer>	
Years between		1	

Name and Syntax	Returns	Description
<pre><datetime1>.yearsBetween (<datetime2>)</datetime2></datetime1></pre>	Integer	Returns the Integer number of years between <pre>pateTime1> and <pre>pate2></pre>. This function returns a positive number if <pre><pre><pre><pre>continue2> is later than <pre><pre>continue2></pre>.</pre></pre></pre></pre></pre></pre>
Months between		
<pre><datetime1> .monthsBetween (<datetime2>)</datetime2></datetime1></pre>	Integer	Returns the Integer number of months between <datetime1> and <datetime2>. If the month and year portions of <datetime1> and <datetime2> are the same, the result is zero. This function returns a positive number if <datetime2> is later than <datetime1>.</datetime1></datetime2></datetime2></datetime1></datetime2></datetime1>
Days between	•	
<pre><datetime1> .daysBetween (<datetime2>)</datetime2></datetime1></pre>	Integer	Returns the Integer number of days between <pre><datetime1> and <datetime2>. If the two dates differ by less than a full 24-hour period, the value is zero. This function returns a positive number if <datetime2> is later than <datetime1>.</datetime1></datetime2></datetime2></datetime1></pre>
Hours between	•	
<pre><datetime1> .hoursBetween (<datetime2>)</datetime2></datetime1></pre>	Integer	Returns the Integer number of hours between <pre>DateTime1> and <pre>DateTime2></pre>. If the two dates differ by less than a full hour, the value is zero. This function returns a positive number if <pre>CDateTime2></pre> is later than <pre>CDateTime1></pre>.</pre>
Minutes between	•	
<pre><datetime1> .minsBetween (<datetime2>)</datetime2></datetime1></pre>	Integer	Returns the Integer number of minutes between <datetime1> and <datetime2>. This function returns a positive number if <datetime2> is later than <datetime1>.</datetime1></datetime2></datetime2></datetime1>
Seconds between		,
<pre><datetime1> .secsBetween (<datetime2>)</datetime2></datetime1></pre>	Integer	Returns the Integer number of seconds between <datetime1> and <datetime2>. This function returns a positive number if <datetime2> is later than <datetime1>.</datetime1></datetime2></datetime2></datetime1>
Day of Week		•

Name and Syntax	Returns	Description	
<pre><datetime>.dayOfWeek</datetime></pre>	Integer	Returns an Integer corresponding to day of the week, with Sunday equal to 1, in <pre><datetime>.</datetime></pre>	
Week of Year			
<pre><datetime>.weekOfYear</datetime></pre>	Integer	Returns an Integer from 1 to 52, equal to the week number within the year in <datetime></datetime>	
Day of Year			
<pre><datetime>.dayOfYear</datetime></pre>	Integer	Returns an Integer from 1 to 366, equal to the day number within the year in <pre><datetime></datetime></pre>	
Week of Month	•		
<pre><datetime>.weekOfMonth</datetime></pre>	Integer	Returns an Integer from 1 to 6, equal to the week number within the month in <pre><datetime> or <date>. A week begins on Sunday and ends on Saturday.</date></datetime></pre>	
To Date	· ·		
<pre><datetime>.toDate</datetime></pre>	Date	Returns the date portion only of DateTime	
To Time	•		
<pre><datetime>.toTime</datetime></pre>	Time	Returns the time portion only of DateTime	
To String			
<pre><datetime>.toString</datetime></pre>	String	Converts DateTime to a String with date and time information	
getMilliseconds	•		
<datetime>.getMilliseconds</datetime>	Integer	Returns the internal date/time, namely the number of milliseconds that have transpired since the epoch 1/1/1970 00:00:00 GMT.	
toString			
<datetime>.toString</datetime>	Integer	Converts the value of <datetime> to data type <string>.</string></datetime>	
toZulu			
<datetime>.toZulu</datetime>	String	Returns an ISO-8601-compliant date-time as a String.	

Date

Corticon's **Date** attribute operators are as follows:

Name and Syntax	Returns	Description	
Equals (used as a comparison)			
<pre><date1> = <date2></date2></date1></pre>	Boolean	Returns a value of true if <date1> is the same as <date2>.</date2></date1>	
Equals (used as an assignment)	•		
<pre><date1> = <date2></date2></date1></pre>	DateTime	Assigns the value of <date2> to <date1></date1></date2>	
Not Equal To	•		
<pre><date1> <> <date2></date2></date1></pre>	Boolean	Returns a value of true if <date1> does not equal <date2></date2></date1>	
Less than	•		
<pre><date1> < <date2></date2></date1></pre>	Boolean	Returns a value of true if <date1> is less than <date2></date2></date1>	
Greater than	•		
<pre><date1> > <date2></date2></date1></pre>	Boolean	Returns a value of true if <date1> is greater than or equal to <date2></date2></date1>	
Less than or Equal to			
<pre><date1> <= <date2></date2></date1></pre>	Boolean	Returns a value of true if <date1> is less than or equal to <date2></date2></date1>	
Greater than or Equal to			
<pre><date1> >= <date2></date2></date1></pre>	Boolean	Returns a value of true if <date1> is greater than or equal to <date2></date2></date1>	
Year			
<date>.year</date>	Integer	Returns the century/year portion of <date></date>	
Month			
<date>.month</date>	Integer	Returns the month in <date> as an Integer between 1 and 12</date>	
Day	•	•	

Name and Syntax	Returns	Description	
<date>.day</date>	Integer	Returns the day portion of <date> as an Integer between 1 and 31</date>	
Add years			
<pre><date> .addYears(<integer>)</integer></date></pre>	Date	Adds the number of years in <integer> to the number of years in <date></date></integer>	
Add months			
<pre><date> .addMonth(<integer>)</integer></date></pre>	Date	Adds the number of months in <integer> to the number of months in <datetime></datetime></integer>	
Add days			
<pre><date> .addDays(<integer>)</integer></date></pre>	Date	Adds the number of days in <integer> to the number of days in <date></date></integer>	
Years between			
<pre><date1> .yearsBetween(<date2>)</date2></date1></pre>	Integer	Returns the Integer number of years between <pre>between <pre>pate1> and <pre>pate2></pre>. This function returns a positive number if <pre><pre><pre><pre>cpate2> is later than <pre>cpate1></pre>.</pre></pre></pre></pre></pre></pre>	
Months between			
<pre><date1> .monthsBetween(<date2>)</date2></date1></pre>	Integer	Returns the Integer number of months between <date1> and <date2>. If the month and year portions of <date1> and <date2> are the same, the result is zero. This function returns a positive number if <date2> is later than <date1>.</date1></date2></date2></date1></date2></date1>	
Days between			
<pre><date1> .daysBetween(<date2>)</date2></date1></pre>	Integer	Returns the Integer number of days between <pre><pre><pre><pre><pre>Date1> and <pre><pre>Date2></pre>. If the two dates differ by less than a full 24-hour period, the value is zero. This function returns a positive number if <pre><pre><pre>cpre><pre>Date2></pre> is later than <pre><pre><pre>Date1></pre>.</pre></pre></pre></pre></pre></pre></pre></pre></pre></pre></pre>	
Day of Week			
<date> .dayOfWeek</date>	Integer	Returns an Integer corresponding to day of the week, with Sunday equal to 1, in <pre><date>.</date></pre>	
Week of Year		<u> </u>	

Name and Syntax	Returns	Description		
<pre><date> .weekOfYear</date></pre>	Integer	Returns an Integer from 1 to 52, equal to the week number within the year in <date></date>		
Day of Year	•			
<date> .dayOfYear</date>	Integer	Returns an Integer from 1 to 366, equal to the day number within the year in <date></date>		
Week of Month				
<date> .weekOfMonth</date>	Integer	Returns an Integer from 1 to 6, equal to the week number within the month in <pre><datetime> or <date>. A week begins on Sunday and ends on Saturday.</date></datetime></pre>		
To String				
<date> .toString</date>	String	Converts DateTime to a String with date and time information		
To DateTime				
<date> .toDateTime</date>	DateTime	Returns a DateTime where the date portion is equal to the value of <date> and the time portion is equal to 00:00:00 in the system's local timezone</date>		
To DateTime with Timezone Offset				
<pre><date> .toDateTime (<string>)</string></date></pre>	DateTime	Returns a DateTime where the date portion is equal to the value of <date> and the time portion is equal to 00:00:00 in the timezone specified by the value of <string></string></date>		
getMilliseconds	getMilliseconds			
toString	toString			
<date>.toString</date>	Integer	Converts the value of <date> to data type <string>.</string></date>		
<date>.getMilliseconds</date>	Integer	Returns the internal date/time, namely the number of milliseconds that have transpired since the epoch 1/1/1970 00:00:00 GMT.		
nextDay				
<date>.nextDay</date>	Date	Returns the Date that represents the date that follows this Date instance.		

Time

Corticon's **Time** attribute operators are as follows:

Name and Syntax	Returns	Description		
Equals (used as a comparison)	Equals (used as a comparison)			
<time1> = <time2></time2></time1>	Boolean	Returns a value of true if <time1> is the same as <time2>, including both the Date and the Time portions</time2></time1>		
Equals (used as an assignment)				
<time1> = <time2></time2></time1>	DateTime	Assigns the value of <time2> to <time1></time1></time2>		
Not Equal To				
<time1> <> <time2></time2></time1>	Boolean	Returns a value of true if <time1> does not equal <time2></time2></time1>		
Less than				
<time1> < <time2></time2></time1>	Boolean	Returns a value of true if <time1> is less than <time2></time2></time1>		
Greater than				
<time1>> <time2></time2></time1>	Boolean	Returns a value of true if <time1> is greater than <time2></time2></time1>		
Less than or Equal to				
<time1> <= <time2></time2></time1>	Boolean	Returns a value of true if <time1> is less than or equal to <time2></time2></time1>		
Greater than or Equal to	Greater than or Equal to			
<time1> >= <time2></time2></time1>	Boolean	Returns a value of true if <time1> is greater than or equal to <time2></time2></time1>		
Hour				
<time>.hour</time>	Integer	Returns the hour portion of <time>. The returned value is based on a 24-hour clock.</time>		
Minute				
<time>.min</time>	Integer	Returns the minute portion of <time> as an Integer between 0 and 59</time>		
Second	•			

Name and Syntax	Returns	Description	
<time>.Sec</time>	Integer	Returns the seconds portion of <time> as an Integer between 0 and 59</time>	
<time> .addDays (<integer>)</integer></time>	Date	Adds the number of days in <integer> to the number of days in <time></time></integer>	
Add hours			
<time> .addHours (<integer>)</integer></time>	Date	Adds the number of hours in <integer> to the number of hours in the Time portion of <time></time></integer>	
Add minutes	•		
<time> .addMinutes (<integer>)</integer></time>	Date	Adds the number of minutes in <integer> to the number of minutes in the Time portion of <time></time></integer>	
Add seconds	•		
<time> .addSeconds (<integer>)</integer></time>	Date	Adds the number of seconds in <integer> to the number of seconds in the Time portion of <time></time></integer>	
Hours between			
<time1>.hoursBetween (<time2>)</time2></time1>	Integer	Returns the Integer number of hours between <time1> and <time2>. If the two times differ by less than a full hour, the value is zero. This function returns a positive number if <time2> is later than <time1>.</time1></time2></time2></time1>	
Minutes between			
<time1> .minsBetween (<time2>)</time2></time1>	Integer	Returns the Integer number of minutes between <time1> and <time2>. This function returns a positive number if <time2> is later than <time1>.</time1></time2></time2></time1>	
Seconds between			
<time1> .secsBetween (<time2>)</time2></time1>	Integer	Returns the Integer number of seconds between <time1> and <time2>. This function returns a positive number if <time2> is later than <time1>.</time1></time2></time2></time1>	
To String			
<time>.toString</time>	String	Converts <time> to a String with date and time information</time>	

Name and Syntax	Returns	Description		
To DateTime	To DateTime			
<time>.toDateTime</time>	DateTime	Returns a DateTime where the time portion is equal to the value of <time> and the date portion is equal to the epoch.</time>		
toString				
<time>.toString</time>	Integer	Converts the value of <time> to data type <string>.</string></time>		
getMilliseconds				
<time>.getMilliseconds</time>	Integer	Returns the internal date/time, namely the number of milliseconds that have transpired since the epoch 1/1/1970 00:00:00 GMT.		
toString	•			
<time>.toString</time>	Integer	Converts the value of <time> to data type <string>.</string></time>		
getTimeName				
<time>.getTimeName</time>	String	Returns a String that states whether the time is morning, afternoon, or evening.		

Decimal

In this section, wherever the syntax includes <Number>, either Integer or Decimal data types may be used.

Corticon's **Decimal** attribute operators are as follows:

Name and Syntax	Returns	Description	
Equals (used as a comparison)			
<number1> = <number2></number2></number1>	Boolean	Returns a value of true if <number1> is the same as <number2>.</number2></number1>	
Equals (used as an assignment)			
<number1> = <number2></number2></number1>	Number	Assigns the value of <number2> to the value of <number1>.</number1></number2>	
Not Equal To			
<number1> <> <number2></number2></number1>	Boolean	Returns a value of true if <number1> is not equal to <number2>.</number2></number1>	

Name and Syntax	Returns	Description
Less than	,	
<number1> < <number2></number2></number1>	Boolean	Returns a value of true if <number1> is less than <number2>.</number2></number1>
Greater than		
<number1> > <number2></number2></number1>	Boolean	Returns a value of true if <number1> is greater than <number2>.</number2></number1>
Less than or Equal to		
<number1> <= <number2></number2></number1>	Boolean	Returns a value of true if <number1> is less than or equal to <number2>.</number2></number1>
Greater than or Equal to		
<number1> >= <number2></number2></number1>	Boolean	Returns a value of true if <number1> is greater than or equal to <number2>.</number2></number1>
Add	•	
<number1> + <number2></number2></number1>	Number	Returns the sum of <number1> and <number2>. The resulting data type is the more expansive of either <number1> or <number2>. For example, if an Integer value is added to a Decimal value, the resulting value will be a Decimal. See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>
Subtract	,	
<number1> - <number2></number2></number1>	Number	Subtracts <number2> from <number1>. The resulting data type is the more expansive of either <number1> or <number2>. See Arithmetic operator precedence on page 193.</number2></number1></number1></number2>
Multiply	•	•
<number1> * <number2></number2></number1>	Number	Returns the product of <number1> and <number2>. The resulting data type is the more expansive of either <number1> or <number2>. See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>
Divide		

Name and Syntax	Returns	Description
<number1>/<number2></number2></number1>	Number	Divides <number1> by <number2>. The resulting data type is the more expansive of either <number1> or <number2>. See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>
Exponent	<u> </u>	•
<number1> ** <number2></number2></number1>	Number	Raises <number1> to the power of <number2>. The resulting data type is the more expansive of either <number1> or <number2>. See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>
Increment		•
<number1> += <number2></number2></number1>	Number	Increments <number1> by <number2>. The data type of <number1> must accommodate the addition of <number2> . See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>
Decrement	•	•
<number1> -= <number2></number2></number1>	Number	Decrements <number1> by the value of <number2>. The data type of <number1> must accommodate the addition of <number2>. See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>
Absolute Value	.	•
<decimal>.absVal</decimal>	Decimal	Returns the absolute value of <number>. If the <number> is positive, <number> itself is returned; if <number> is negative, the negation of <number> is returned.</number></number></number></number></number>
Floor		•
<pre><decimal>.floor</decimal></pre>	Integer	Returns the largest (closest to positive infinity) Integer that is not greater than <number>.</number>
Round	•	•
<pre><decimal>.round</decimal></pre>	Decimal	Rounds < Decimal > to the nearest Integer.
Round(n)	•	•
<pre><decimal>.round(<integer>)</integer></decimal></pre>	Decimal	Rounds <pre><pre> Rounds <pre> <pre></pre></pre></pre></pre>
To Integer		

Name and Syntax	Returns	Description		
<pre><decimal>.toInteger</decimal></pre>	Integer	Converts an attribute of type Decimal to type Integer. Decimals will have the decimal point and fraction (those digits to the right of the decimal point) truncated.		
To String				
<pre><decimal>.toString</decimal></pre>	String	Converts an attribute of type Decimal to type string		
Maximum Value				
<pre><decimal> .max(<number>)</number></decimal></pre>	Number	Returns the greater of <decimal> and <number>.</number></decimal>		
Minimum Value	•			
<pre><decimal> .min(<number>)</number></decimal></pre>	Number	Returns the lesser of <decimal> and <number>.</number></decimal>		
Logarithm (base 10)	Logarithm (base 10)			
<pre><decimal>.log</decimal></pre>	Decimal	Returns the logarithm (base 10) of <pre><pre><decimal>. <decimal> may not be zero.</decimal></decimal></pre></pre>		
Logarithm (base x)				
<pre><decimal1> .log(<decimal2>)</decimal2></decimal1></pre>	Decimal	Returns the logarithm (base <decimal2>) of <decimal1>. <decimal1> may not be zero.</decimal1></decimal1></decimal2>		
Natural Logarithm		,		
<decimal>.ln</decimal>	Decimal	Returns the logarithm (base e) of <pre><pre><decimal>.<decimal> may not be zero.</decimal></decimal></pre></pre>		
truncate				
<pre><decimal>.truncate</decimal></pre>	Integer	Truncates "this" Decimal value to an integer by removing the fractional portion.		
toString				
<pre><decimal>.fraction</decimal></pre>	Decimal	Extracts the fraction portion of "this" Decimal.		
movePoint(places)				
<pre><decimal>.movePoint (places:Integer)</decimal></pre>	Decimal	Moves the Decimal value's point moved n places where n can be a positive (moves right) or negative (moves left) value.		

Integer

In this section, wherever the syntax includes <Number>, either Integer or Decimal data types may be used.

Corticon's **Integer** attribute operators are as follows:

Name and Syntax	Returns	Description		
Equals (used as a comparison)				
<number1> = <number2></number2></number1>	Boolean	Returns a value of true if <number1> is the same as <number2>.</number2></number1>		
Equals (used as an assignment)	,			
<number1> = <number2></number2></number1>	Number	Assigns the value of <number2> to the value of <number1>. The data type of <number1> must be expansive enough to accommodate <number2>.</number2></number1></number1></number2>		
Not Equal To				
<number1> <> <number2></number2></number1>	Boolean	Returns a value of true if <number1> is not equal to <number2>.</number2></number1>		
Less than	Less than			
<number1> < <number2></number2></number1>	Boolean	Returns a value of true if <number1> is less than <number2>.</number2></number1>		
Greater than				
<number1> > <number2></number2></number1>	Boolean	Returns a value of true if <number1> is greater than <number2>.</number2></number1>		
Less than or Equal to	Less than or Equal to			
<number1> <= <number2></number2></number1>	Boolean	Returns a value of true if <number1> is less than or equal to <number2>.</number2></number1>		
Greater than or Equal to				
<number1> >= <number2></number2></number1>	Boolean	Returns a value of true if <number1> is greater than or equal to <number2>.</number2></number1>		
Add				

Name and Syntax	Returns	Description
<number1> + <number2></number2></number1>	Number	Returns the sum of <number1> and <number2>. The resulting data type is the more expansive of either <number1> or <number2>. For example, if an Integer value is added to a Decimal value, the resulting value will be a Decimal. See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>
Subtract		
<number1> - <number2></number2></number1>	Number	Subtracts <number2> from <number1>. The resulting data type is the more expansive of either <number1> or <number2>. See Arithmetic operator precedence on page 193.</number2></number1></number1></number2>
Multiply	'	•
<number1> * <number2></number2></number1>	Number	Returns the product of <number1> and <number2>. The resulting data type is the more expansive of either <number1> or <number2>. See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>
Divide		
<number1>/<number2></number2></number1>	Number	Divides <number1> by <number2>. The resulting data type is the more expansive of either <number1> or <number2>. See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>
Exponent		•
<number1> ** <number2></number2></number1>	Number	Raises <number1> to the power of <number2>. The resulting data type is the more expansive of either <number1> or <number2>. See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>
Increment	•	•
<number1> += <number2></number2></number1>	Number	Increments <number1> by <number2>. The data type of <number1> must accommodate the addition of <number2>. See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>
Decrement	J	•

Name and Syntax	Returns	Description	
<number1> -= <number2></number2></number1>	Number	Decrements <number1> by the value of <number2>. The data type of <number1> must accommodate the addition of <number2>. See Arithmetic operator precedence on page 193.</number2></number1></number2></number1>	
Absolute value on page 54.	•		
<integer>.absVal</integer>	Number	Returns the absolute value of <integer>. If the <integer> is positive, <integer> itself is returned; if <integer> is negative, the negation of <integer> is returned.</integer></integer></integer></integer></integer>	
To Decimal			
<pre><integer>.toDecimal</integer></pre>	Decimal	Converts an attribute of type Integer to type Decimal.	
To String			
<pre><integer>.toString</integer></pre>	String	Converts an attribute of type Integer to type String.	
Maximum Value			
<pre><integer1> .max(<integer2>)</integer2></integer1></pre>	Integer	Returns the greater of <integer1> and <integer2>.</integer2></integer1>	
Minimum Value			
<pre><integer1> .min(<integer2>)</integer2></integer1></pre>	Integer	Returns the lesser of <integer1> and <integer2>.</integer2></integer1>	
Div	•		
<pre><integer1> .div(<integer2>)</integer2></integer1></pre>	Integer	Returns the whole number of times that <integer2> fits within <integer1> - any remainder is discarded.</integer1></integer2>	
Mod	•		
<pre><integer1> .mod(<integer2>)</integer2></integer1></pre>	Integer	Returns the whole number remainder that results from dividing <integer1> by <integer2>. If the remainder is a fraction, then zero is returned.</integer2></integer1>	
Logarithm (base 10)			
<integer> .log</integer>	Decimal	Returns the logarithm (base 10) of <integer>. <integer> may not be zero.</integer></integer>	

Name and Syntax	Returns	Description
Logarithm (base x)		
<pre><integer> .log(<decimal>)</decimal></integer></pre>	Decimal	Returns the logarithm (base < Decimal >) of < Integer >. < Integer > may not be zero.
Natural Logarithm		
<integer>.ln</integer>	Decimal	Returns the natural logarithm (base e) of <pre><number>. <integer> may not be zero.</integer></number></pre>
isProbablePrime(certainty)		
<pre><integer>.isProbablePrime (certainty:Integer)</integer></pre>	Boolean	Returns true if this Integer is probably prime; false if definitely is not prime.
gcd(val)		
<pre><integer>.gcd(val:Integer)</integer></pre>	Integer	Returns the greatest common divisor of the absolute value of this and the absolute value of val.
negate		
<integer>.negate</integer>	Integer	Returns the negative value of this integer.

String

Corticon's **String** attribute operators are as follows:

Name and Syntax	Returns	Description
Equals (used as a comparison)	Y	
<string1> = <string2></string2></string1>	Boolean	Returns a value of true if <string1> exactly matches <string2>. Both case and length are examined to determine equality. See Character precedence: Unicode & Java Collator on page 189 for character precedence.</string2></string1>
Equals (used as an assignment)		
<string1> = <string2></string2></string1>	String	Assigns the value of <string2> to the value of <string1>.</string1></string2>
Not Equal to		
<string1> <> <string2></string2></string1>	Boolean	Returns a value of true if <string1> is not equal to <string2>.</string2></string1>

Name and Syntax	Returns	Description	
Less than			
<string1> < <string2></string2></string1>	Boolean	Returns a value of true if <string1> is less than <string2>. See Character precedence: Unicode & Java Collator on page 189 for character precedence.</string2></string1>	
Greater than on page 94			
<string1>> <string2></string2></string1>	Boolean	Returns a value of true if <string1> is greater than <string2>. See Character precedence: Unicode & Java Collator on page 189 for character precedence.</string2></string1>	
Less than or Equal to			
<string1> <= <string2></string2></string1>	Boolean	Returns a value of true if <string1> is less than or equal to <string2>. See Character precedence: Unicode & Java Collator on page 189 for character precedence.</string2></string1>	
Greater than or Equal to			
<string1> >= <string2></string2></string1>	Boolean	Returns a value of true if <string1> is greater than or equal to <string2>. See Character precedence: Unicode & Java Collator on page 189 for character precedence.</string2></string1>	
Adding Strings			
<string1> + <string2></string2></string1>	String	Concatenates <string1> to <string2>. Alternative syntax.</string2></string1>	
Size	-		
<string>.size</string>	String	Returns the number of characters in <pre><string>.</string></pre>	
Concatenate	•		
<string1>.concat(<string2>)</string2></string1>	String	Concatenates <string1> to <string2>.</string2></string1>	
Uppercase			
<string>.toUpper</string>	String	Converts all characters <string> to uppercase.</string>	
Lowercase	•		

Name and Syntax	Returns	Description		
<string>.toLower</string>	String	Converts all characters in <string> to lowercase.</string>		
To DateTime	,			
<string>.toDateTime</string>	DateTime	Converts the value in <string> to data type DateTime ONLY if all characters in <string> correspond to a valid DateTime mask (format)</string></string>		
To Decimal				
<string>.toDecimal</string>	Decimal	Converts an attribute of type String to data type Decimal ONLY if all characters in <string> are numeric and contain not more than one decimal point. If any non-numeric characters are present (other than a single decimal point or leading minus sign), no value is returned.</string>		
To Integer				
<string>.toInteger</string>	Integer	Converts an attribute of type String to type Integer ONLY if all characters in <string> are numeric. If any non-numeric characters are present, no value is returned.</string>		
Substring				
<pre><string> .substring (<integer1>,<integer2>)</integer2></integer1></string></pre>	String	Returns that portion of <string> between character positions <integer1> and Integer2>.</integer1></string>		
Equals Ignoring Case	Equals Ignoring Case			
<pre><string1> .equalsIgnoreCase (<string2>)</string2></string1></pre>	Boolean	Returns a value of true if <string1> is the same as <string2>, irrespective of case.</string2></string1>		
Starts with				
<pre><string1> .startsWith (<string2>)</string2></string1></pre>	Boolean	Returns a value of true if the <string1> begins with the characters specified in <string2>.</string2></string1>		
Ends with				
<pre><string1> .endsWith (<string2>)</string2></string1></pre>	Boolean	Evaluates the contents of <string1> and returns a value of true if the String ends with the characters specified in <string2>.</string2></string1>		
Contains				

Name and Syntax	Returns	Description
<string1>.contains (<string2>)</string2></string1>	Boolean	Evaluates the contents of <string1> and returns a value of true if it contains the exact characters defined by <string2></string2></string1>
Equals	,	
<string1> .equals (<string2>)</string2></string1>	Boolean	Returns a value of true if <string1> is the same as <string2>.</string2></string1>
Index Of		
<string1>.indexOf(<string2)< td=""><td>Integer</td><td>Returns the beginning character position number of <pre>string2> within <pre>string1>,</pre> if <pre>string1> contains <pre>contains</pre> string2>. If it does not, the function returns a value of zero.</pre></pre></td></string2)<></string1>	Integer	Returns the beginning character position number of <pre>string2> within <pre>string1>,</pre> if <pre>string1> contains <pre>contains</pre> string2>. If it does not, the function returns a value of zero.</pre></pre>
containsBlanks	`	
<string>.containsBlanks</string>	Boolean	Determines whether the specified String contains any blanks.
characterAt(index)		
<pre><string>.characterAt(index:Integer)</string></pre>	String	Returns the character at the specified position in the String.
isInteger		
<string>.isInteger</string>	Boolean	Determines whether "this" String contains only integer digits.
trimSpaces		
<string>.trimSpaces</string>	String	Trims leading and trailing spaces from "this" String.
charsIn(validSet)		
<pre><string>.charsIn(validSet:String)</string></pre>	Boolean	Determines whether "this" String contains only characters specified in the validSet.

Entity/Association operators

The Corticon rule language supports Entity and Association operators categorized as Entity, Collection, and Sequence.

Entity

Corticon's **Entity** operators are as follows:

Name and Syntax	Returns	Description
New		
<pre><entity>.new[<expression1>,]</expression1></entity></pre>	Entity	Creates a new instance of <entity>. Expressions (optional) in square brackets [] must be written in the form: attribute = value.</entity>
New Unique		
<pre><entity> .newUnique [<expression1>,]</expression1></entity></pre>	Entity	Creates a new instance of <entity> only if the instance created is unique as defined by optional <expression1>,</expression1></entity>
Remove		
<entity>.remove</entity>	Entity	Deletes the entity from memory and from the resultant XML document.

Collection

Corticon's **Collection** operators are as follows:

Name and Syntax	Returns	Description	
Replace element(s)			
<collection1> = <collection2> <collection1> = <entity></entity></collection1></collection2></collection1>	modifies a collection	replaces all elements in <collection1> with elements of <collection2> or with <entity>, provided the new associations are allowed by the Business Vocabulary.</entity></collection2></collection1>	
Associate element(s)	Associate element(s)		
<collection1> += <collection2> <collection1> += <entity></entity></collection1></collection2></collection1>	modifies a collection	Associates all elements of <collection2> or <entity> with <collection1>. Every <collection> must be expressed as a unique alias.</collection></collection1></entity></collection2>	
Disassociate element(s)			
<collection1>-=<collection2></collection2></collection1>	modifies a collection	Disassociates all elements of <collection2> from <collection1>. Does not delete the disassociated elements. Every <collection> must be expressed as a unique alias.</collection></collection1></collection2>	

Name and Syntax	Returns	Description
Is empty	•	
<collection> ->isEmpty</collection>	Boolean	Returns a value of true if <collection> contains no elements</collection>
Not empty		
<collection> ->notEmpty</collection>	Boolean	Returns a value of true if <collection> contains at least one element.</collection>
Exists		
<collection> ->exists (<expression>)</expression></collection>	Boolean	Returns a value of true if <expression> holds true for at least one element of <collection></collection></expression>
For all	,	
<collection> ->forAll (<expression>)</expression></collection>	Boolean	Returns a value of true if every <pre><expression> holds true for every element of <collection></collection></expression></pre>
Sorted by		
<collection> ->sortedBy (<attribute>)</attribute></collection>	converts a collection into a sequence	Sequences the elements of <collection> in ascending order, using the value of <attribute> as the index. <collection> must be expressed as a unique alias.</collection></attribute></collection>
Sorted by descending		
<collection> ->sortedByDesc (<attribute>)</attribute></collection>	converts a collection into a sequence	Sequences the elements of <collection> in descending order, using the value of <attribute> as the index. <collection> must be expressed as a unique alias.</collection></attribute></collection>
Iterate		
<collection> ->iterate(<expression>)</expression></collection>		Executes <expression> for every element in <collection>. <collection> must be expressed as a unique alias.</collection></collection></expression>
Size of collection	•	
<collection> ->size</collection>	Integer	Returns the number of elements in <collection>. <collection> must be expressed as a unique alias.</collection></collection>
Sum		

Name and Syntax	Returns	Description	
<collection.attribute> ->sum</collection.attribute>	Number	Sums the values of the specified <attribute> for all elements in <collection>. <attribute> must be a numeric data type.</attribute></collection></attribute>	
Average			
<collection.attribute> ->avg</collection.attribute>	Number	Averages all of the specified attributes in <pre><collection>. <collection> must be expressed as a unique alias. <attribute> must be a numeric data type</attribute></collection></collection></pre>	
Minimum			
<collection.attribute>->min</collection.attribute>	Number	Returns the lowest value of <attribute> for all elements in <collection>. <attribute> must be a numeric data type</attribute></collection></attribute>	
Maximum	Maximum		
<collection.attribute> ->max</collection.attribute>	Number	Returns the highest value of <attribute> for all elements in <collection>. <attribute> must be a numeric data type</attribute></collection></attribute>	
toSet	•		
Collection.toSet	String	Returns a single String that is the set of Strings in this collection.	
allContain(lookFor)			
Collection.allContain (lookFor:String)	Boolean	Determines whether all the strings in this collection contain the lookFor String	
uniqueCount			
Collection.uniqueCount	Integer	Returns the count of the unique Strings in this collection.	

Sequence

Sequence operators act on collections that have *already* been ordered by a sorting operator (see sortedBy and sortedByDesc). In other words, sequence operators operate on collections that have been turned into sequences. The notation <Sequence> used below, is shorthand for a completed sorting operation. For example:

<Collection> -> sortedBy(<Attribute>)

produces a <Sequence>, in this case the elements of <Collection> arranged in ascending order using <Attribute> as the index. This <Sequence> can then be used with one of the sequence operators described below. The design of the Object Constraint Language (upon which the Corticon Rule Language is based), allows for the "chaining" of operators, so a collection operator and a sequence operator can be used in the same expression to produce a sequence and identify a particular element of that sequence in the same step. For example:

<Entity.attribute1> = <Collection> sortedBy(<Attribute3>) first.<Attribute2>
performs the following:

- 1. Sorts <Collection> in ascending order according to <Attribute3>, turning it into a <Sequence>
- 2. Locates the first element of <Sequence>
- 3. Reads the value of Attribute2 of the first element
- 4. Assigns the value of Attribute2> of the first element to <Entity.attribute1>

Corticon's **Sequence** operators are as follows:

	Name and Syntax	Returns	Description	
At	At			
	<sequence> ->at(<integer>)</integer></sequence>	Entity	Returns the element at position <integer>. <sequence> must be expressed as a unique alias.</sequence></integer>	
Fi	First			
	<sequence> ->first</sequence>	Entity	Returns the first element of <sequence>. <sequence> must be expressed as a unique alias.</sequence></sequence>	
La	Last			
	<sequence> ->last</sequence>	Entity	Returns the last element of <sequence>. <sequence> must be expressed as a unique alias.</sequence></sequence>	
Tre	Trend			
	<attribute> -> <sequence>.trend"><attribute> -> <sequence>.trend</sequence></attribute></sequence></attribute>	String	Returns a 4-character string, INCR, DECR, CNST, or NONE depending on the trend of Attribute within Sequence .	
ma	mavg(elements)			
	<pre><sequence.decimal> .mavg(elements:Integer)</sequence.decimal></pre>	Decimal	Returns a single decimal value that is the average of the number of elements specified.	

	Name and Syntax	Returns	Description
So	orted Alias: next		
	->next		Operates against a Sorted Alias (a special cached Sequence) inside a filter expression. The Rulesheet is set into a Ruleflow that iterates to bind the alias in each successive invocation to the next element in the sequence. For more information, see the topic "Sorted Alias" in the Collections chapter of the Corticon Studio: Rule Modeling Guide

Extended Operators

Corticon's Extended operators are categorized as RandomGenerator and SeMath.

RandomGenerator

RandomGenerator does just what it says: it generates -- and then returns -- a random number.

Corticon's RandomGenerator operator is as follows:

Name and Syntax	Returns	Description
getRandomNumber		
RandomGenerator. getRandomNumber	Decimal	Returns the next random number out of the current static Random object.

SeMath

Corticon's SeMath operators are as follows:

Name and Syntax	Returns	Description
getCircumference	,	
SeMath.getCircumference (radius: <decimal>)</decimal>	Decimal	Converts the specified radius to circumference.
getFahrenheit		
SeMath.getFahrenheit (centigrade: <decimal>)</decimal>	Decimal	Converts the specified Centigrade temperature to Fahrenheit.

Name and Syntax	Returns	Description
replaceString		
<pre>SeMath.replaceString (lookin:<string>,lookfor:<string> ,replacewith:<string>)</string></string></string></pre>	String	Replaces all occurences of a specified string with another string.

Rule operator details and examples

The following pages describe each operator in greater detail. Each Rule Operator has the following sections

- 1. **Syntax** Describes the standard syntax used with this operator. In this section, as in the previous summary tables, the angle bracket convention < . . > is used to indicate what types of terms and their data types can be used with the operator. When using the operator with real terms from the Vocabulary, do not include the angle brackets.
- **2. Description** Provides a plain-language description of the operator's purpose and details of its use. Important reminders, tips, or cautions are included in this section.
- 3. Usage Restrictions Describes what limitations exist for this operator, and where an operator may not be used in a Rulesheet. Such limitations are rare, but important to a good understanding of Corticon Studio.
- **4. Example** Shows an example of each operator in a Rulesheet. A screenshot of the example Rulesheet is provided, with portions of the Rulesheet not used by the example collapsed or truncated for clarity. The example also includes sample input and output data for Ruletest scenarios run against the Rulesheet.

The entire list of operators is presented in alphabetic order.

For details, see the following topics:

- Absolute value
- Add numbers
- Add strings
- Add days
- Add hours

- Add minutes
- Add months
- Add seconds
- Add years
- Associate element(s)
- At
- Average
- CellValue
- Concatenate
- Contains
- Day
- Days between
- Day of week
- Day of year
- Decrement
- Disassociate element(s)
- Divide
- Div
- Ends with
- Equals used as an assignment
- Equals used as a comparison
- Equals ignoring case
- Equals strings only
- Exists
- Exponent
- False
- First
- Floor
- For all
- Greater than
- Greater than or equal to
- Hour
- Hour between

- Increment
- Index of
- Is empty
- Iterate
- Last
- Less than
- Less than or equal to
- Logarithm (Base 10)
- Logarithm (Base x)
- Lowercase
- Maximum value
- Maximum value (Collection)
- Minimum value
- Minimum value (Collection)
- Minute
- Minutes between
- Mod
- Month
- Months between
- Multiply
- Natural logarithm
- New
- New unique
- Not
- Not empty
- Not equal to
- Now
- Null
- Other

- Round

- Second
- Seconds between
- Size of string
- Size of collection
- Sorted by
- Sorted by descending
- Starts with
- Substring
- Subtract
- Sum
- Today
- To date casting a dateTime to a date
- To dateTime casting a string to a dateTime
- To dateTime casting a date to a dateTime
- To dateTime casting a time to a dateTime
- To dateTime timezone offset
- To decimal
- To integer
- To string
- To time casting a dateTime to a time
- Trend
- True
- Uppercase
- · Week of month
- Week of year
- Year
- Years between

Absolute value

SYNTAX

<Number>.absVal

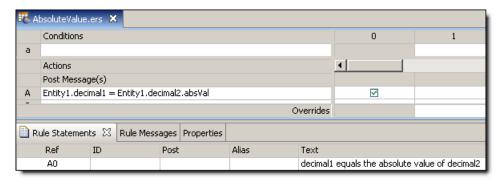

Returns the absolute value of <Number>. If the <Number> is positive, <Number> itself is returned; if <Number> is negative, the negation of <Number> is returned.

USAGE RESTRICTIONS

The Operators row in the table of Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

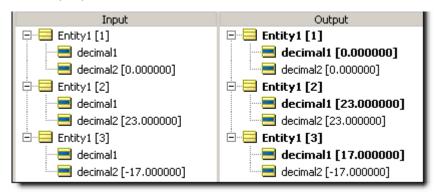

RULESHEET EXAMPLE

This sample Rulesheet uses .absVal to produce the absolute value of decimal2 and assign it to decimal1

SAMPLE RULETEST

A sample Ruletest provides decimal2 values for three different scenarios of Entity1. Input and Output panels are shown below.

Add numbers

SYNTAX

<Number1> + <Number2>

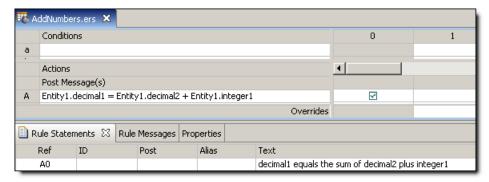

Adds <Number1> to <Number2>. The resulting data type is the more expansive of those of <Number1> and <Number2>. For example, if you are adding an Integer value and a Decimal value, the resulting value will be a Decimal. See Arithmetic operator precedence on page 193.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

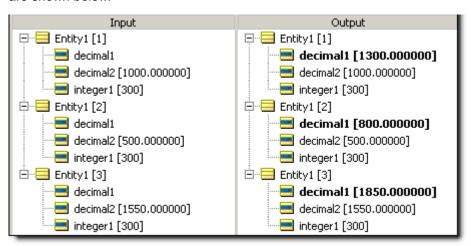

RULESHEET EXAMPLE

This sample Rulesheet uses the add numbers operation to add the value of decimal2 to the value of integer1 and assign the result to decimal1

SAMPLE RULETEST

A sample Ruletest provides an integer1 value of 300 which is added to the value of decimal2 and assigned to the value of decimal1 for three instances of Entity1. Input and Output panels are shown below.

Add strings

SYNTAX

<String1> + <String2>

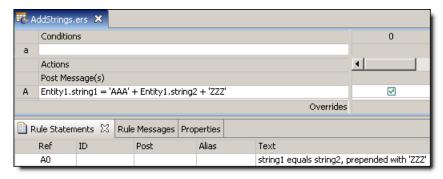

Adds <String1> to <String2>. This has the same effect as using the .concat operator. However, the "+" syntax permits concatenation of more than two String values without nesting, as shown in the example below.

USAGE RESTRICTIONS

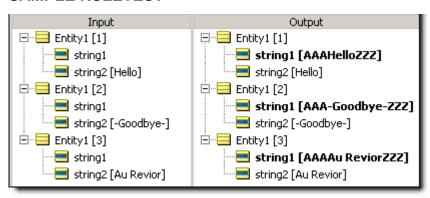

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

This sample Rulesheet uses add strings operation to add the String AAA to string2 to zzz and assign the result to string1

SAMPLE RULETEST

Add days

SYNTAX

<DateTime>.addDays(<Integer>)
<Date>.addDays(<Integer>)

DESCRIPTION

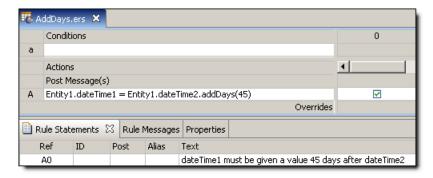

Adds the number of days in <Integer> to the number of days in <DateTime> or <Date>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

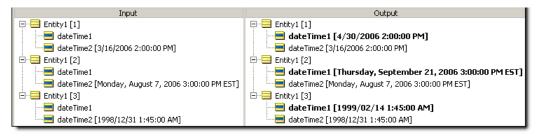

RULESHEET EXAMPLE

This sample Rulesheet uses .addDays to add 45 days to the value of dateTime2 and assign the result to dateTime1.

SAMPLE RULETEST

A sample Ruletest provides values of dateTime2 for three instances of Entity1. Input and Output panels are shown below. Notice the month portion of dateTime1 also changes accordingly.

Add hours

SYNTAX

<DateTime>.addHours(<Integer>)
<Time>.addHours(<Integer>)

DESCRIPTION

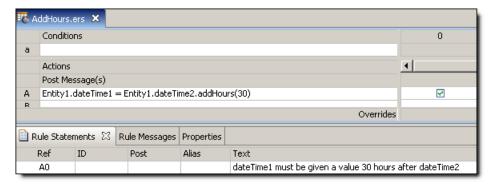

Adds the number of hours in <Integer> to the number of hours in the Time portion of <DateTime> or <Time>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

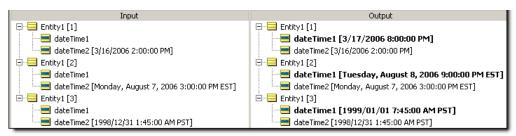

RULESHEET EXAMPLE

This sample Rulesheet uses the . addHours to add 30 hours to the value of dateTime2 and assign the result to dateTime1.

SAMPLE RULETEST

A sample Ruletest provides values of dateTime2 for three instances of Entity1. Input and Output panels are shown below.

Add minutes

SYNTAX

<DateTime>.addMinutes(<Integer>)

<Time>.addMinutes(<Integer>)

DESCRIPTION

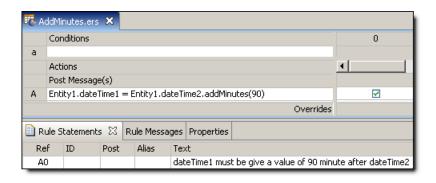

Adds the number of minutes in <Integer> to the number of minutes in the Time portion of <DateTime> or <Time>.

USAGE RESTRICTIONS

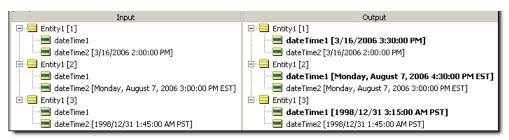

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

This sample Rulesheet uses the . addMinutes add 90 minutes to the value of dateTime2 and assign the result to dateTime1.

A sample Ruletest provides values of dateTime2 for three instances of Entity1. Input and Output panels are shown below.

Add months

SYNTAX

<DateTime>.addMonths(<Integer>)

<Date>.addMonths(<Integer>)

DESCRIPTION

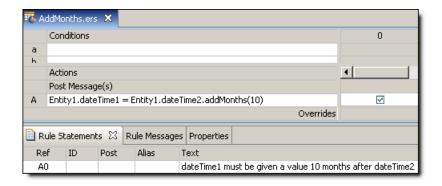

Adds the number of months in <Integer> to the number of months in <DateTime> or <Date>.

USAGE RESTRICTIONS

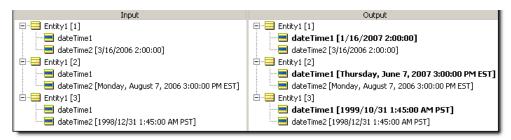

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

This sample Rulesheet uses . addMonths in a Nonconditional rule to add 10 months to the value of dateTime2 and assign the result to dateTime1.

A sample Ruletest provides values of dateTime2 for three instances of Entity1. Input and Output panels are shown below. Notice the year portion of dateTime1 also changes accordingly.

Add seconds

SYNTAX

<DateTime>.addSeconds(<Integer>)

<Time>.addSeconds(<Integer>)

DESCRIPTION

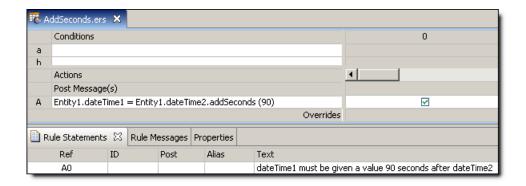

Adds the number of seconds in <Integer> to the number of seconds in the Time portion of <DateTime> or <Time>.

USAGE RESTRICTIONS

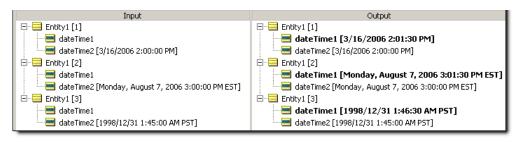

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

This sample Rulesheet uses .addSeconds in a Nonconditional rule to add 90 seconds to the value of timeOnly2 and assign the result to timeOnly1.

A sample Ruletest provides values of timeOnly2 for three instances of Entity1. Input and Output panels are shown below. Notice how the time "wraps" around to the beginning of the day, even though Time data type does not include date information.

Add years

SYNTAX

<DateTime>.addYears(<Integer>)

<Date>.addYears(<Integer>)

DESCRIPTION

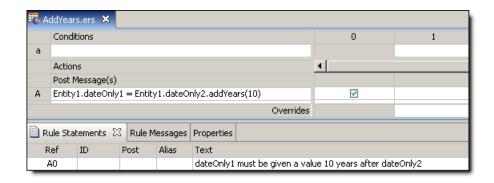

Adds the number of years in <Integer> to the number of years in the Date portion of <DateTime> or <Date>.

USAGE RESTRICTIONS

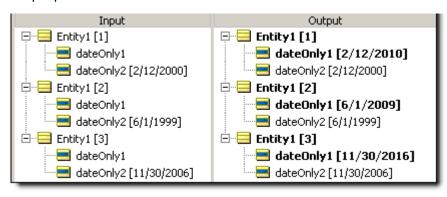

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

This sample Rulesheet uses .addYears in a Nonconditional rule to add 10 years to the value of dateOnly2 and assign the result to dateOnly1.

A sample Ruletest provides values of dateOnly2 for three instances of Entity1. Input and Output panels are shown below.

Associate element(s)

SYNTAX

<Collection1> += <Collection2> <Collection1> += <Entity>

DESCRIPTION

Associates all elements of <Collection2> or a single element named <Entity> with <Collection1>, provided such an association is allowed by the Vocabulary. Every <Collection> must be expressed as a unique alias.

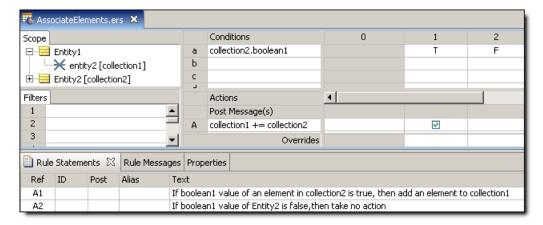

If the cardinality of the association between the parent entity of <Collection> and the <Entity> being added is "one-to-one" (a straight line icon beside the association in the Rule Vocabulary), then this **associate element** syntax is <u>not</u> used. Instead, replace element syntax is used, since the collection can contain only one element, and any element present will be replaced by the new element.

USAGE RESTRICTIONS

The Operators row of the table in Vocabulary usage restrictions does not apply. Special exceptions: **associate element** may <u>only</u> be used in Action Rows (section 5 in Sections of Rulesheet that correlate with usage restrictions).

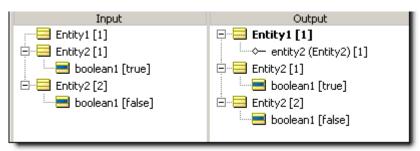

RULESHEET EXAMPLE

The following Rulesheet uses associate element to associate an element of <code>collection2</code> to <code>collection1</code> when <code>boolean1</code> value of any element in <code>collection2</code> is <code>true</code>. Note that the Action is not associating all elements in <code>collection2</code> with <code>collection1</code>, only those elements within <code>collection2</code> that satisfy the condition.

SAMPLE RULETEST

A sample Ruletest provides two examples of Entity2 with boolean1 values, and a single Entity1. Input and Output panels are described below:

At

SYNTAX

<Sequence> ->at(<Integer>).<Attribute1>

DESCRIPTION

Returns the value of Attribute1 for the element at position <Integer in <Sequence>. Another operator, such as sortedBy, must be used to transform a <Collection into a <Sequence> before at may be used. <Sequence> must be expressed as a unique alias. See Advanced Collection Syntax for more examples of usage.

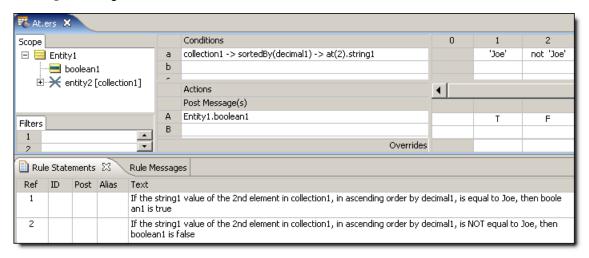

Attribute1> may be of any data type.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

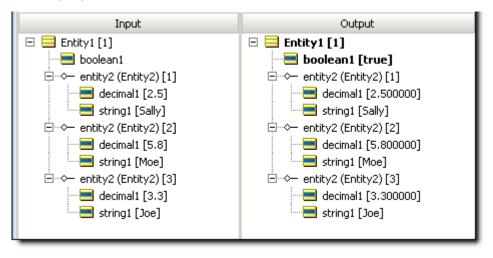

RULESHEET EXAMPLE

This sample Rulesheet uses ->at(2) to identify the second element of the sequence created by applying sortedBy to collection1. Once identified, the value of the string1 attribute belonging to this second element is evaluated. If the value of string1 is Joe, then boolean1 attribute of Entity1 is assigned the value of true.

SAMPLE RULETEST

A sample Ruletest provides a collection of three elements, each with a decimal1 value. Input and Output panels are shown below.

Average

SYNTAX

<Collection.attribute> ->avg

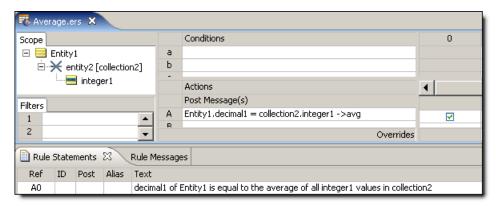

Averages the values of all of the specified attributes in <Collection>. <Collection> must be expressed as a unique alias. <attribute> must be a numeric data type.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

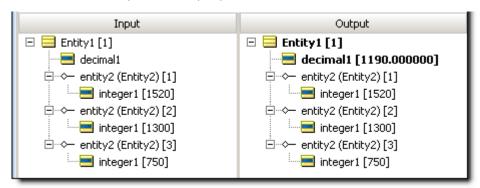

RULESHEET EXAMPLE

This sample Rulesheet uses ->avg to average the integer1 values of all elements in collection2, then assigns the resulting value to decimal1 in Entity1. Note the use of the alias collection2 to represent the collection of Entity2 elements associated with Entity1.

SAMPLE RULETEST

A sample Ruletest provides integer1 values for three elements in collection2. The following illustration shows Input and Output panels:

CellValue

SYNTAX

Various, see Examples below

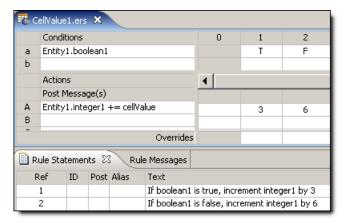

When used in an expression, **cellValue** is essentially a variable whose value is determined by the rule Column that executes. Using **cellValue** in a Condition or Action expression eliminates the need for multiple, separate Rows to express the same logic.

USAGE RESTRICTIONS

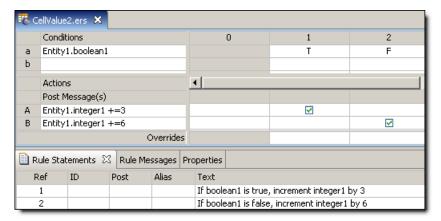

The Operators row of the table in Vocabulary usage restrictions does not apply. Special exceptions: **cellValue** may <u>only</u> be used in Condition and Action Rows (sections 3 and 5 in Sections of Rulesheet that correlate with usage restrictions).

RULESHEET EXAMPLE 1

This sample Rulesheet uses **cellValue** to increment integer1 by the amount in the Action Cell of the rule Column that fires. An equivalent Rulesheet which does not use cellValue is also shown for comparison purposes.

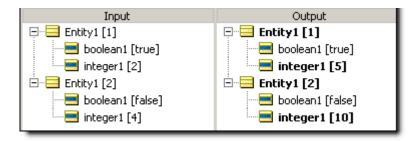

Equivalent Rulesheet without using **cellValue**:

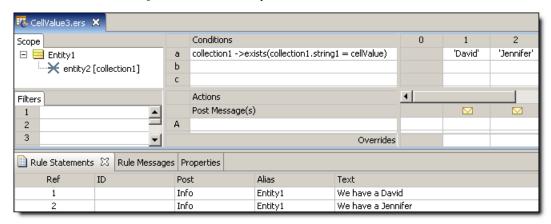

SAMPLE RULETEST 1

A sample Ruletest provides two examples of boolean1. The following table shows Input and Output panels.

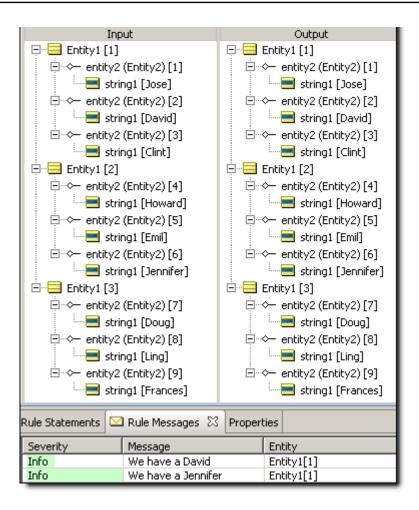

RULESHEET EXAMPLE 2

The following Rulesheet uses **cellValue** to evaluate whether collection1 includes at least one member with a string1 value of the entry in the Conditions Cell of the rule Column.

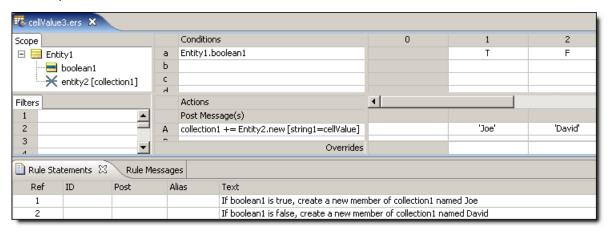

SAMPLE RULETEST 2

A sample Ruletest provides three examples of <code>collection1</code> – each member has a <code>string1</code> value. Input and Output panels are shown below.

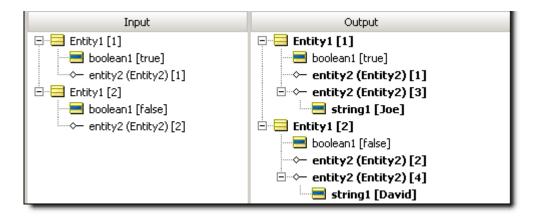

RULESHEET EXAMPLE 3

The following Rulesheet uses **cellValue** to create a new member of collection1 with string1 value equal to the Action Cell in the rule Column that fires.

SAMPLE RULETEST 3

A sample Ruletest provides string1 values for three examples. The following illustration shows Ruletest Input and Output panels. Notice that each collection1 already has one element prior to executing the test. This simply ensures the results will be displayed in hierarchical style.

Concatenate

SYNTAX

<String1>.concat(<String2>)

DESCRIPTION

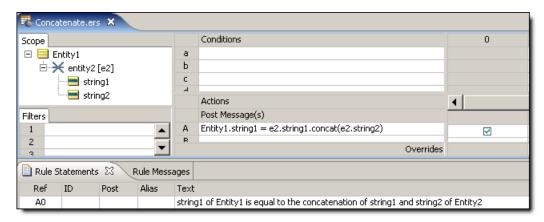

Concatenates <String1> to <String2>, placing <String2> at the end of <String1>

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions

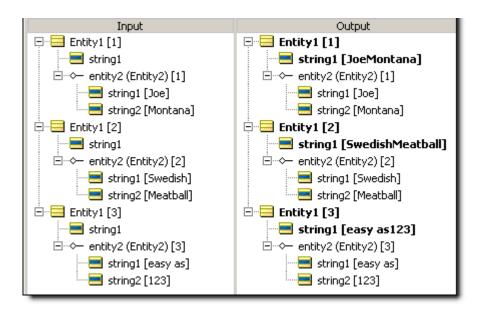

RULESHEET EXAMPLE

This sample Rulesheet uses .concat to create string1 by combining string1 and string2 from Entity1.entity2.

SAMPLE RULETEST

A sample Ruletest provides three examples of string1 and string2. Input and Output panels are shown below.

Contains

SYNTAX

<String1>.contains(<String2>)

DESCRIPTION

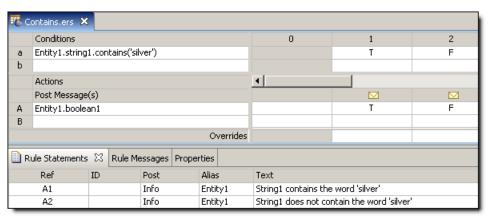

Evaluates <String1> and returns a value of true if it contains or includes the exact (case-sensitive) characters specified in <String2>.

USAGE RESTRICTIONS

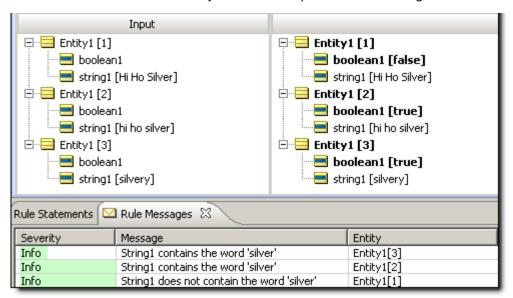

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions

RULESHEET EXAMPLE 1

The following uses .contains to evaluate whether string1 includes the characters silver and assigns a value to boolean1 for each outcome.

A sample Ruletest provides string1 values for three examples. Input and Output panels are shown below. Note case sensitivity in these examples. Posted messages are not shown.

Day

SYNTAX

<DateTime>.day
<Date>.day
.

DESCRIPTION

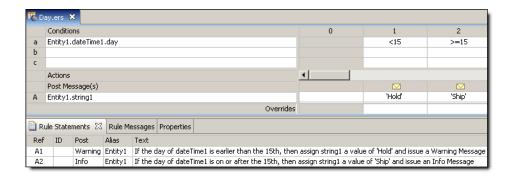

Returns the day portion of <DateTime> or <Date> as an Integer between 1 and 31.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

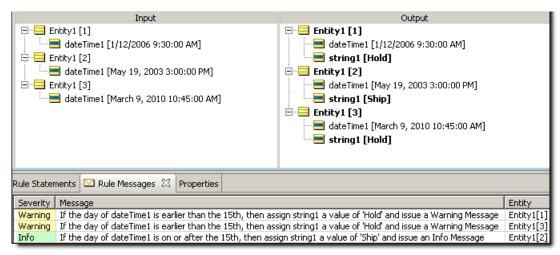

RULESHEET EXAMPLE

The following Rulesheet uses .day to assign a value to string1 and post a message.

SAMPLE RULETEST

A sample Ruletest provides dateTime1 values for three examples. Input and Output panels are shown below. Posted messages are not shown.

Days between

SYNTAX

<DateTime1>.daysBetween(<DateTime2>)

<Date1>.daysBetween(<Date2>)

DESCRIPTION

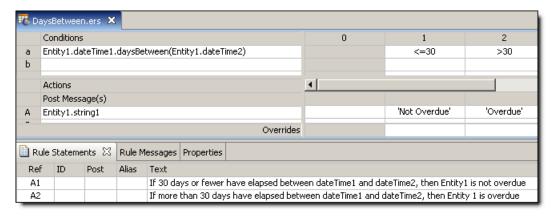

Returns the Integer number of days between DateTimes or Dates. This function calculates the number of milliseconds between the date values and divides that number by 86,400,000 (the number of milliseconds in a day). Any fraction is truncated, leaving an Integer result. If the two dates differ by less than a full 24-hour period, the value returned is zero. A positive Integer value is returned when SpateTime2> occurs after SpateTime1>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions

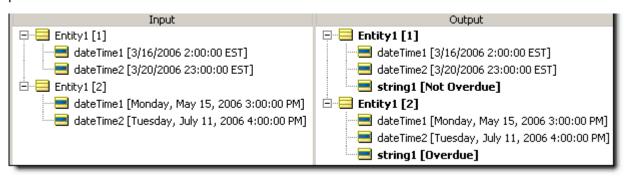

RULESHEET EXAMPLE

The following Rulesheet uses .daysBetween to determine the number of days that have elapsed between dateTime1 and dateTime2, compare it to the values in the Condition cells, and assign a value to string1.

SAMPLE RULETEST

A sample Ruletest provides dateTime1 and dateTime2 for two examples. Input and Output panels are shown below.

Day of week

SYNTAX

<DateTime>.dayOfWeek
<Date>.dayOfWeek

DESCRIPTION

Returns an Integer between 1 and 7, corresponding to the table below:

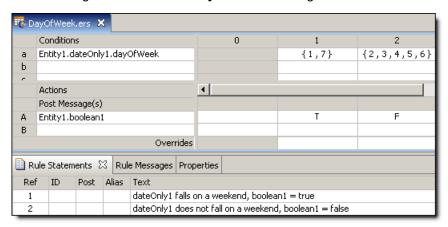

returned Integer	day of the week
1	Sunday
2	Monday
3	Tuesday
4	Wednesday
5	Thursday
6	Friday
7	Saturday

USAGE RESTRICTIONS

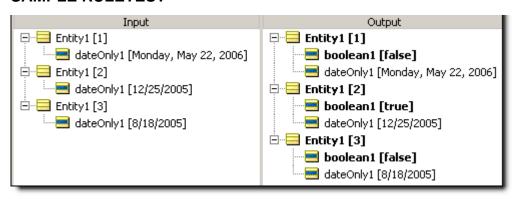

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions

RULESHEET EXAMPLE

The following Rulesheet uses .dayOfWeek to assign a value to boolean1.

SAMPLE RULETEST

Day of year

SYNTAX

<DateTime>.dayOfYear
<Date>.dayOfYear

DESCRIPTION

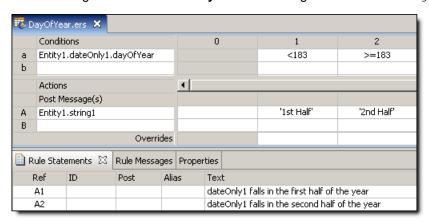

Returns an Integer from 1 to 366, equal to the day number within the year.

USAGE RESTRICTIONS

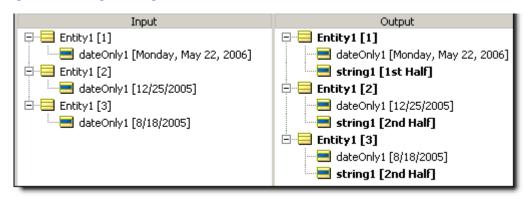

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions

RULESHEET EXAMPLE

The following Rulesheet uses .dayOfYear to assign a value to string1.

SAMPLE RULETEST

Decrement

SYNTAX

<Number1> -= <Number2>

DESCRIPTION

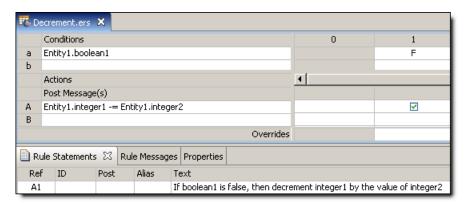

Decrements <Number1> by the value of <Number2>. The data type of <Number1> must accommodate the subtraction of <Number2>. In other words, an Integer may not be decremented by a Decimal without using another operator (such as .toInteger or Floor on page 91) to first convert the Decimal to an Integer.

USAGE RESTRICTIONS

The Operators row of the table in Vocabulary usage restrictions does not apply. Special exceptions: **decrement** may <u>only</u> be used in Action Rows (section 5 in Sections of Rulesheet that correlate with usage restrictions).

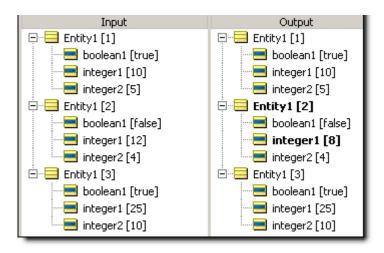

RULESHEET EXAMPLE

This sample Rulesheet uses decrement to reduce integer1 by the value of integer2 when boolean1 is false.

SAMPLE RULETEST

A sample Ruletest provides three examples of integer1, integer2, and boolean1. Input and Output panels are shown below.

Disassociate element(s)

SYNTAX

<Collection1> -= <Collection2>

DESCRIPTION

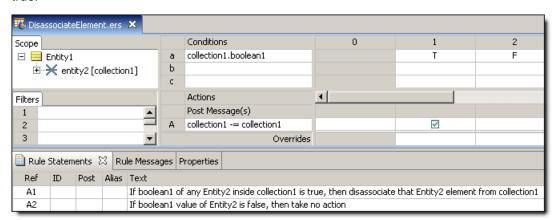

Disassociates all elements of <Collection2> from <Collection1>. Elements are not deleted, but once disassociated from <Collection1>, they are moved to the "root" level of the data. <Collection1> must be expressed as a unique alias. Contrast this behavior with remove, which deletes elements entirely.

USAGE RESTRICTIONS

The Operators row of the table in Vocabulary usage restrictions does not apply. Special exceptions: **disassociate element** may <u>only</u> be used in Action Rows (section 5 in Sections of Rulesheet that correlate with usage restrictions).

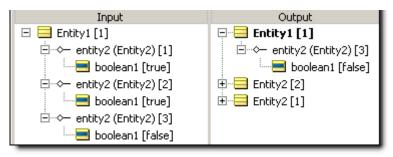

RULESHEET EXAMPLE

This sample Rulesheet removes those elements from collection1 whose boolean1 value is true.

SAMPLE RULETEST

A sample Ruletest provides a collection with three elements. The illustration shows Input and Output panels:

Divide

SYNTAX

<Number1>/<Number2>

DESCRIPTION

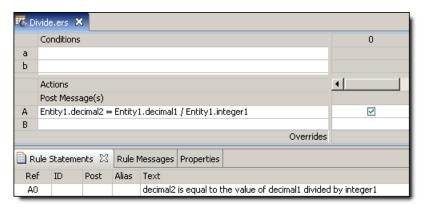

Divides <Number1> by <Number2>. The resulting data type is the more expansive of those of <Number1> and <Number2>.

USAGE RESTRICTIONS

The Operators row in the table of Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

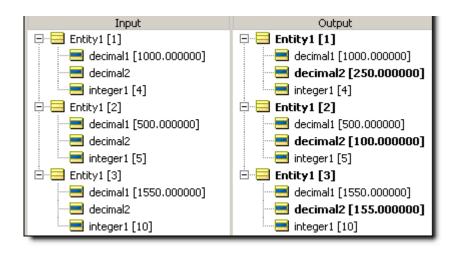

RULESHEET EXAMPLE

This sample Rulesheet uses divide to divide decimal1 by integer1 and assign the resulting value to decimal2

SAMPLE RULETEST

A sample Ruletest provides decimal1 and integer1 values for three examples. Input and Output panels are shown below.

Div

SYNTAX

<Integer1>.div(<Integer2>)

DESCRIPTION

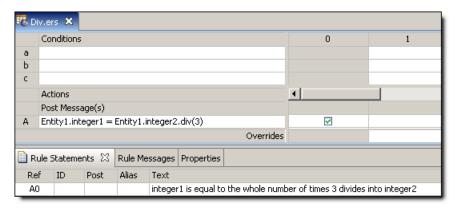

Returns an Integer equal to the whole number of times that <Integer2> divides into <Integer1>. Any remainder is discarded.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

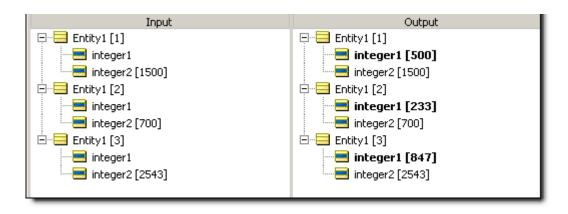

RULESHEET EXAMPLE

This sample Rulesheet uses .div to calculate the whole number of times 3 divides into integer2, and assigns the resulting value to integer1.

SAMPLE RULETEST

A sample Ruletest provides integer2 values for three examples. Input and Output panels are shown below.

Ends with

SYNTAX

<String1>.endsWith(<String2>)

DESCRIPTION

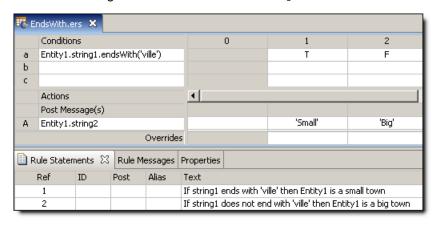

Evaluates <String1> and returns a value of true if it ends with the characters specified in <String2>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

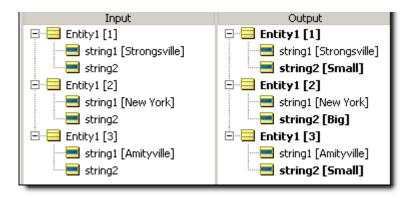

RULESHEET EXAMPLE

The following Rulesheet uses **.endsWith** to evaluate whether string1 ends with the characters ville and assigns a different value to string2 for each outcome.

SAMPLE RULETEST

A sample Ruletest provides string1 values for three examples. Input and Output panels are shown below.

Equals – used as an assignment

SYNTAX

Boolean	<boolean1> = <expression1></expression1></boolean1>
DateTime*	<datetime1> = <datetime2></datetime2></datetime1>
Number	<number1> = <number2></number2></number1>
String	<string1> = <string2></string2></string1>

DESCRIPTION

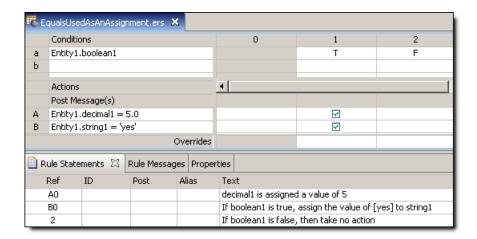

Boolean	Assigns the truth value of <expression1> to <boolean1>.</boolean1></expression1>
DateTime*	Assigns the value of <datetime2> to <datetime1>.</datetime1></datetime2>
Number	Assigns the value of <number2> to <number1>. Automatic casting (the process of changing a value's data type) which includes DateTime, Date, or Time data types will occur when assigning an Integer data type to a Decimal data type. To assign a Decimal value to an Integer value, use the .toInteger operator.</number1></number2>
String	Assigns the value of <string2> to <string1>.</string1></string2>

USAGE RESTRICTIONS

The Operators row of the table in Vocabulary usage restrictions does not apply. Special exceptions: **equals** used as an assignment may <u>only</u> be used in Action Rows (section 5 in Sections of Rulesheet that correlate with usage restrictions).

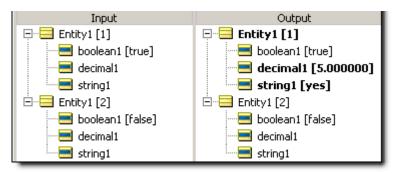

RULESHEET EXAMPLE

The following Rulesheet uses **equals** twice: in an Action row to assign a value to decimal1, and in an Action row to assign a value to string1 based on the value of boolean1.

SAMPLE RULETEST

A sample Ruletest provides two examples of boolean1. Input and Output panels are shown below:

Equals – used as a comparison

SYNTAX

Boolean	<expression1> = <expression2></expression2></expression1>	
DateTime*	<datetime1> = <datetime2></datetime2></datetime1>	
Number	<number1> = <number2></number2></number1>	
String	<string1> = <string2></string2></string1>	

DESCRIPTION

Boolean	Returns a value of true if <expression1> is the same as <expression2>.</expression2></expression1>
DateTime*	Returns a value of true if <datetime1> is the same as <datetime2>, including both the Date and the Time portions</datetime2></datetime1>
Number	Returns a value of true if <number1> is the same as <number2>. Different numeric data types may be compared in the same expression.</number2></number1>
String	Returns a value of true if <string1> is the same as <string2>. Both case and length are examined to determine equality. Corticon Studio uses the ISO character precedence in comparing String values. See Character precedence: Unicode & Java Collator on page 189.</string2></string1>

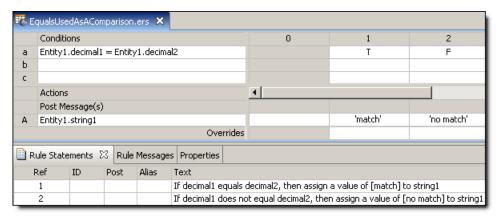

^{*}includes DateTime, Date, and Time data types

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

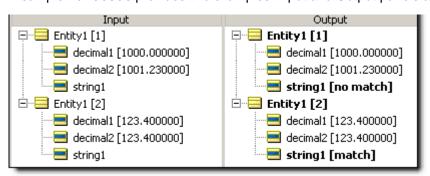

RULESHEET EXAMPLE

The following Rulesheet uses equals to Ruletest whether decimal1 equals decimal2, and assign a value to string1 based on the result of the comparison.

SAMPLE RULETEST

A sample Ruletest provides two examples. Input and Output panels are shown below:

Equals ignoring case

SYNTAX

<String1>.equalsIgnoreCase(<String2>)

DESCRIPTION

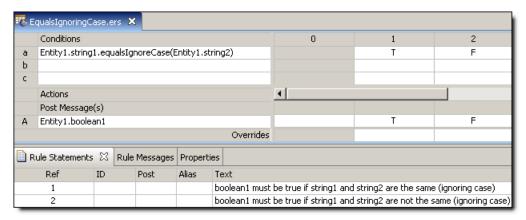

Returns a value of true if <String1> is the same as <String2>, irrespective of case.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

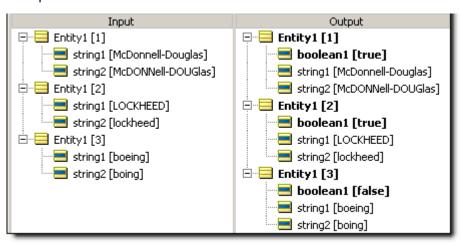

RULESHEET EXAMPLE

This sample Rulesheet uses .equalsIgnoreCase to compare the values of string1 and string2, and assign a value to boolean1 based on the results of the comparison.

SAMPLE RULETEST

A sample Ruletest provides the plane type for three sets of string1 and string2. Input and Output panels are shown below. Notice how these results differ from those shown in the equals example.

Equals – strings only

SYNTAX

<String1>.equals(<String2>)

DESCRIPTION

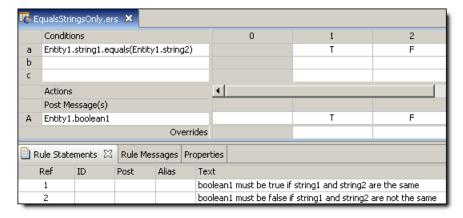

Returns a value of true if <String1> is exactly the same as <String2>, including character case. This is alternative syntax to equals (used as a comparison).

USAGE RESTRICTIONS

The Operators row in the table Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

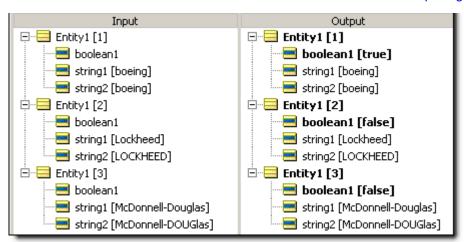

RULESHEET EXAMPLE

This sample Rulesheet uses .equals to compare the contents of string1 and string2, and assign a value to boolean1 as a result.

SAMPLE RULETEST

A sample Ruletest provides three sets of string1 and string2. Input and Output panels are shown below. Notice how these results differ from those shown in the .equalsIgnoreCase example.

Exists

SYNTAX

```
<Collection> ->exists(<Expression1>,<Expression2>,...)
<Collection> ->exists(<Expression1> or <Expression2> or ...)
```

DESCRIPTION

Returns a value of true if <Expression> holds true for at least one element of <Collection>. <Collection> must be expressed as a unique alias. Multiple <Expressions> are optional, but at least one is required.

Both AND (indicated by commas between <Expressions>) and OR syntax (indicated by or between <Expressions>) are supported within the parentheses (..). However, take care to ensure invariant expressions are not inadvertently created. For example:

```
<Collection> -> exists(integer1=5, integer1=8)
```

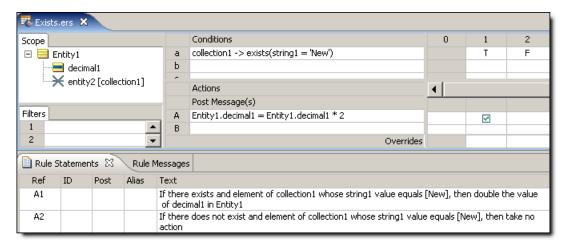

will always evaluate to false because no integer1 value can be both 5 AND 8 simultaneously.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

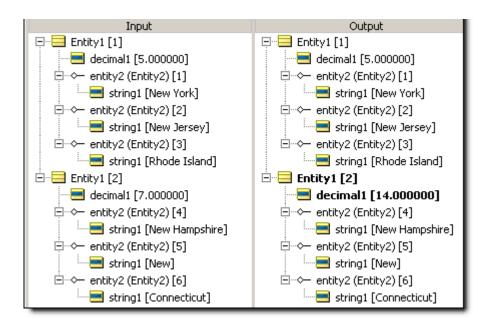

RULESHEET EXAMPLE

This sample Rulesheet uses exists to check for the existence of an element in <code>collection1</code> whose <code>string1</code> value equals <code>New</code>, and assigns a value to <code>decimal1</code> based on the results of the test. Note the use of unique alias <code>collection1</code> to represent the collection of <code>Entity2</code> associated with <code>Entity1</code>.

SAMPLE RULETEST

A sample Ruletest provides 2 separate collections of Entity2 elements and Entity1.decimal1 values. Input and Output panels are shown below.

Exponent

SYNTAX

<Number1> ** <Number2>

DESCRIPTION

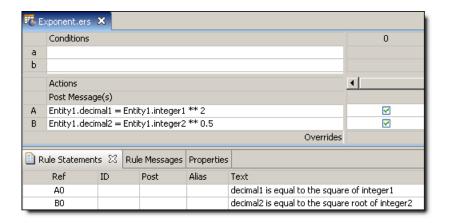

Raises <Number1> by the power of <Number2>. The resulting data type is the more expansive of those of <Number1> and <Number2>. To find a root, <Number2> should be expressed as a fraction. For example, the square root is expressed as 0.5

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

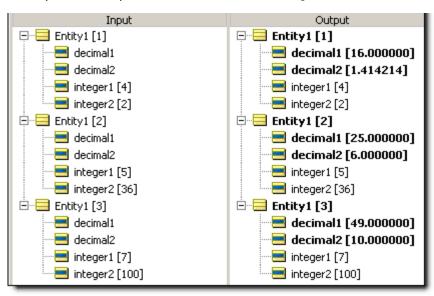

RULESHEET EXAMPLE

This sample Rulesheet uses **exponent** to raise integer1 and integer2 by the power of 2 and 0.5, respectively, and assign the resulting value to decimal1 and decimal2, respectively.

SAMPLE RULETEST

A sample Ruletest provides decimal 1 and integer 1 values for three examples.

False

SYNTAX

false or F

DESCRIPTION

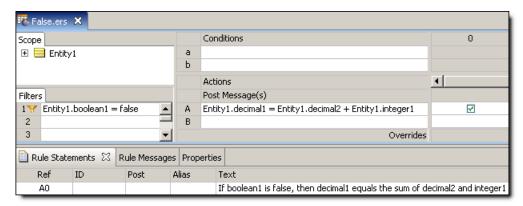

Represents the Boolean value false. Recall from discussion of truth values that an <expression> is evaluated for its truth value, so the expression Entity1.boolean1=false evaluates to true only when boolean1=false. But since boolean1 is Boolean and has a truth value all by itself without any additional syntax, we could simply state not Entity1.boolean1, with the same effect. Many examples in the documentation use explicit syntax like boolean1=true or boolean2=false for clarity and consistency, even though boolean1 or not boolean2 are equivalent, respectively, to the explicit syntax.

USAGE RESTRICTIONS

The Operators row of the table in Vocabulary usage restrictions applies. No special exceptions.

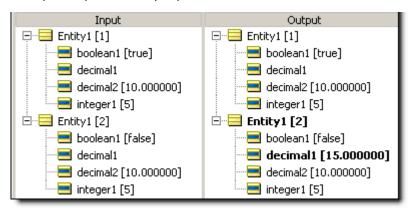

RULESHEET EXAMPLE

The following Rulesheet uses **false** in a Filter row to test whether boolean1 is false, and perform the Nonconditional computation if it is. As discussed above, the alternative expression not <code>Entity1.boolean1</code> is logically equivalent.

SAMPLE RULETEST

A sample Ruletest provides three examples. Assume decimal2=10.0 and integer1=5 for all examples. Input and Output panels are shown below:

First

SYNTAX

<Sequence> ->first.<attribute1>

DESCRIPTION

Returns the value of <attribute1> of the first element in <Sequence>. Another operator, such as sortedBy, must be used to transform a <Collection> into a <Sequence> before first may be used. <Sequence> must be expressed as a unique alias. See Advanced Collection Syntax for more examples of usage.

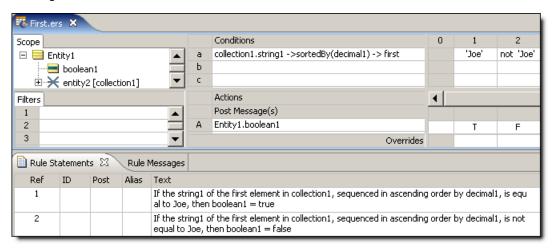

<attribute1> may be of any data type.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

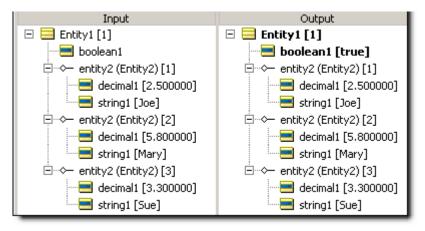

RULESHEET EXAMPLE

This sample Rulesheet uses **first** to identify the first element of the sequence created by applying sortedBy to collection1. Once identified, the value of the string1 attribute belonging to this first element is evaluated. If the value of string1 is Joe, then boolean1 attribute of Entity1 is assigned the value of true.

SAMPLE RULETEST

A sample Ruletest provides a collection of three elements, each with a decimal1 value. Input and Output panels are shown below.

Floor

SYNTAX

<Decimal>.floor

DESCRIPTION

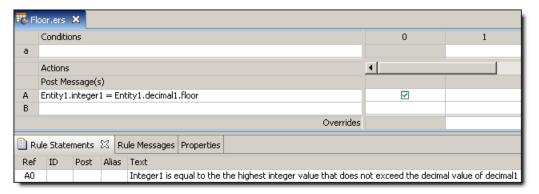

Returns the Integer closest to zero from CDecimal>..floor may also be thought of as a truncation of CDecimal>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

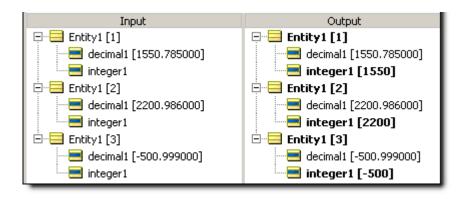

The Rulesheet uses .floor to assign Integer values to integer1 that are closer to zero than the input decimal1 values.

SAMPLE RULETEST

A sample Ruletest provides three decimal1 values. Input and Output panels are shown below:

Note: Notice how these results differ from those shown in the Round example.

For all

SYNTAX

<Collection> ->forAll(<Expression1>, <Expression2>,...)
<Collection> ->forAll(<Expression1> or <Expression2> or ...)

DESCRIPTION

Returns a value of true if every <Expression> holds true for every element of <Collection>. <Collection> must be expressed as a unique alias. Multiple <Expressions> are optional, but at least one is required.

Both AND (indicated by commas between <Expressions>) and OR syntax (indicated by or between <Expressions>) is supported within the parentheses (..). However, take care to ensure invariant expressions are not inadvertently created. For example:

```
<Collection> -> forAll(integer1=5, integer1=8)
```

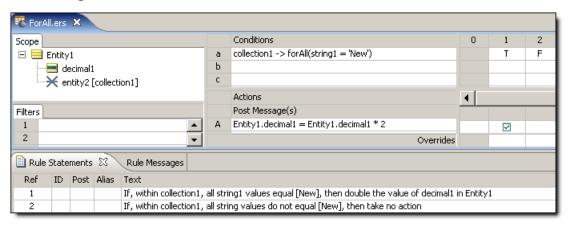

will always evaluate to false because no single integer1 value can be both 5 AND 8 simultaneously, let alone all of them.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

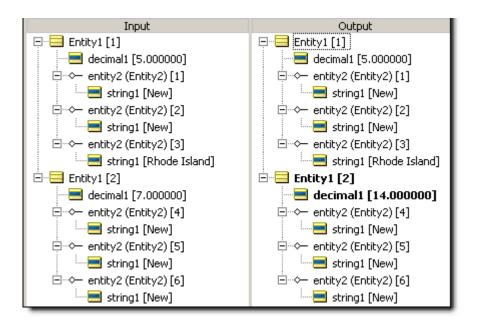

RULESHEET EXAMPLE

This sample Rulesheet uses **forAll** to check for the existence of an element in collection1 whose string1 value equals New, and assigns a value to decimal1 based on the results of the test. Note the use of unique alias collection1 to represent the collection of Entity2 associated with Entity1.

SAMPLE RULETEST

A sample Ruletest provides 2 separate collections of Entity2 elements and Entity1.decimal1 values. The following illustration shows Input and Output panel

Greater than

SYNTAX

DateTime*	<datetime1> > <datetime2></datetime2></datetime1>
Number	<number1> > <number2></number2></number1>
String	<string1> > <string2></string2></string1>

DESCRIPTION

DateTime*	Returns a value of true if <datetime1> is greater than or equal to <datetime2>. This is equivalent to <datetime1> occurring "after" <datetime2></datetime2></datetime1></datetime2></datetime1>
Number	Returns a value of true if <number1> is greater than <number2>. Different numeric data types may be compared in the same expression.</number2></number1>
String	Returns a value of true if <string1> is greater than <string2>. Studio uses Character precedence: Unicode & Java Collator on page 189 to determine character precedence.</string2></string1>

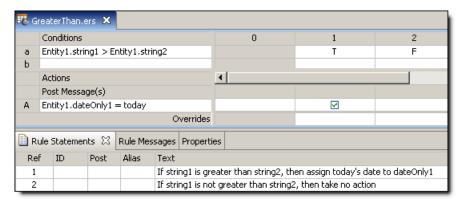

^{*}includes DateTime, Date, and Time data types

USAGE RESTRICTIONS

The Operators row of the table in Vocabulary usage restrictions applies, with the following exception: **greater than** may also be used in Conditional Value Sets & Cells (section 5 in Sections of Rulesheet that correlate with usage restrictions).

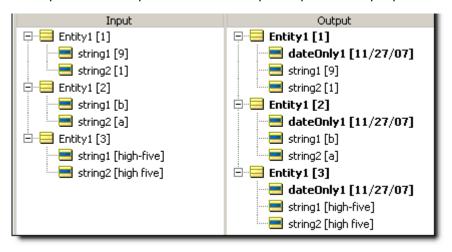

RULESHEET EXAMPLE

The following Rulesheet uses **greater than** to test whether string1 is greater than string2, and assign today's date to dateTime1 if it is. See today for an explanation of this literal term.

SAMPLE RULETEST

A sample Ruletest provides three examples. Input and Output panels are shown below:

Greater than or equal to

SYNTAX

DateTime*	<pre><datetime1> >= <datetime2></datetime2></datetime1></pre>
Number	<number1> >= <number2></number2></number1>
String	<string1> >= <string2></string2></string1>

DESCRIPTION

DateTime*	Returns a value of true if <datetime1> is greater than or equal to <datetime2>. This is equivalent to <datetime1> occurring on or after <datetime2></datetime2></datetime1></datetime2></datetime1>
Number	Returns a value of true if <number1> is greater than or equal to <number2>. Different numeric data types may be compared in the same expression.</number2></number1>
String	Returns a value of true if <string1> is greater than or equal to <string2>. Corticon Studio uses Character precedence: Unicode & Java Collator on page 189 to determine character precedence.</string2></string1>

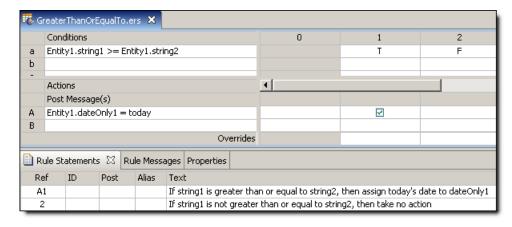

^{*}includes DateTime, Date, and Time data types

USAGE RESTRICTIONS

The Operators row of the table in Vocabulary usage restrictions applies, with the following exception: **greater than or equal to** may also be used in Conditional Value Sets & Cells (section 5 in Sections of Rulesheet that correlate with usage restrictions).

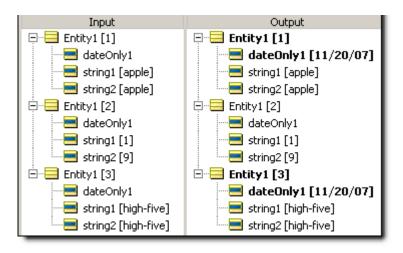

RULESHEET EXAMPLE

The following Rulesheet uses **greater than or equal to** to test whether <code>string1</code> is greater than or equal to <code>string2</code>, and assign today's date to <code>dateTime1</code> if it is. See today for an explanation of this literal term.

SAMPLE RULETEST

A sample Ruletest provides two examples. Input and Output panels are shown below:

Hour

SYNTAX

<DateTime>.hour

<Time>.hour

DESCRIPTION

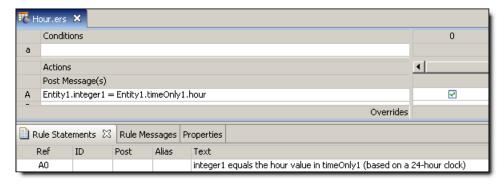

Returns the hour portion of <DateTime> or <Time>. The returned value is based on a 24-hour clock. For example, 10:00 PM (22:00 hours) is returned as 22.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

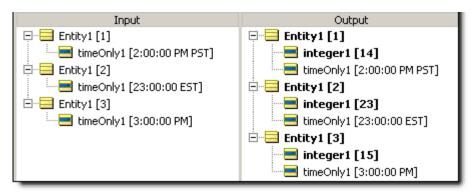

RULESHEET EXAMPLE

The following Rulesheet uses .hour to evaluate dateTime1 and assign the hour value to integer1.

SAMPLE RULETEST

A sample Ruletest provides three examples of dateTime1. Input and Output panels are shown below. Notice that the hour returned is dependent upon the timezone of the machine executing the rule. The hour returned is independent of the machine running the Ruletest and only depends on the locale/timezone of the data itself.

Hour between

SYNTAX

<DateTime1>.hoursBetween(<DateTime2>)

DESCRIPTION

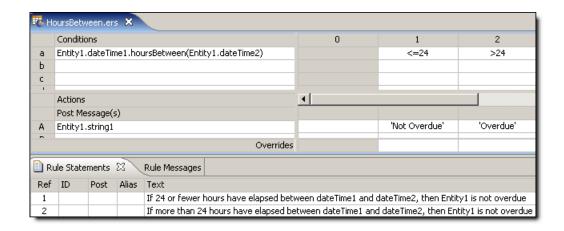

Returns the Integer number of hours between any two DateTimes or Times. The function calculates the number of milliseconds between the two values and divides that number by 3,600,000 (the number of milliseconds in an hour). The decimal portion is then truncated. If the two dates differ by less than a full hour, the value is zero. This function returns a positive number if <DateTime2> is later than <DateTime1>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

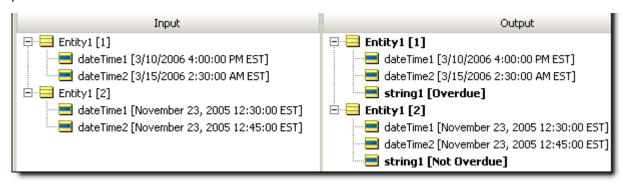

RULESHEET EXAMPLE

The following Rulesheet uses .hoursBetween to determine the number of hours that have elapsed between dateTime1 and dateTime2, compare it to the Values set, and assign a value to string1.

SAMPLE RULETEST

A sample Ruletest provides <code>dateTime1</code> and <code>dateTime2</code> for two examples. Input and Output panels are shown below.

Increment

SYNTAX

<Number1> += <Number2>

DESCRIPTION

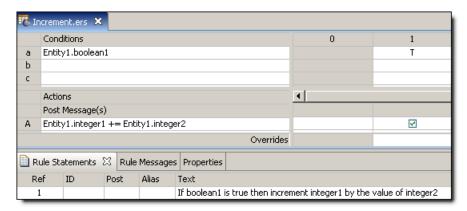

Increments <Number1> by the value of <Number2>. The data type of <Number1> must accommodate the addition of <Number2>. In other words, an Integer may not be incremented by a Decimal without using another operator (such as .toInteger or Floor on page 91.floor) to first convert the Decimal to an Integer.

USAGE RESTRICTIONS

The Operators row of the table in Vocabulary usage restrictions does not apply. Special exceptions: **increment** may <u>only</u> be used in Action Rows (section 5 in Sections of Rulesheet that correlate with usage restrictions).

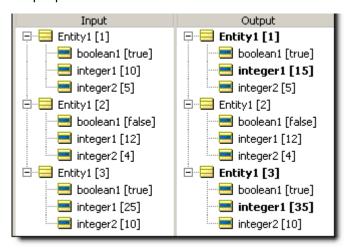

RULESHEET EXAMPLE

This sample Rulesheet uses increment to increment integer1 by the value of integer2 when boolean1 is true.

SAMPLE RULETEST

A sample Ruletest provides three examples of integer1, integer2, and boolean1. Input and Output panels are shown below.

Index of

SYNTAX

<String1>.indexOf(<String2>)

DESCRIPTION

Determines if <string2> is contained within <string1> and returns an Integer value equal to the beginning character position of the first occurrence of <string2> within <string1>. If <string1> does not contain <string2>, then a value of 0 (zero) is returned. This operator is similar to .contains but returns different results. A 0 result from .indexOf is equivalent to a false value returned by the .contains operator.

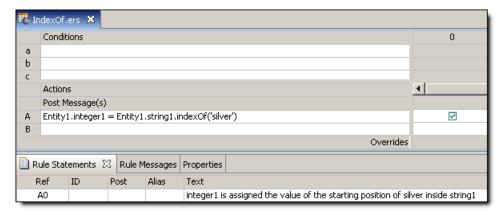

If <String1> contains more than one occurrence of <String2>, .indexOf returns the first character position of the first occurrence. For example: If <String1> holds the String value `Mississippi' and <String2> holds the String value `ss', then the .indexOf operator returns 3. The second occurrence of `ss' beginning at position 6 is not identified.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

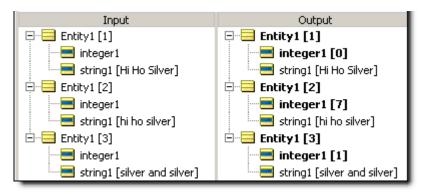

RULESHEET EXAMPLE

The following Rulesheet uses .indexOf to evaluate whether string1 includes the characters silver and assigns a value to integer1 corresponding to the beginning character position of the first occurrence.

SAMPLE RULETEST

A sample Ruletest provides string1 values for three examples. Input and Output panels are shown below. Notice sensitivity to case in example 1.

Is empty

SYNTAX

<Collection> ->isEmpty

DESCRIPTION

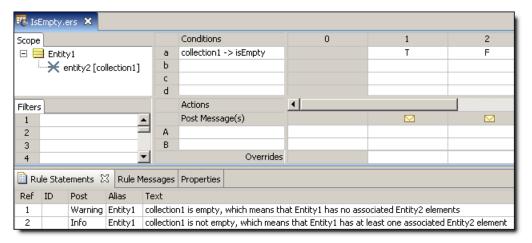

Returns a value of true if <Collection> contains no elements (that is, has no children). **isEmpty** does not check for an empty or null value of an attribute, but instead checks for *existence* of elements within the collection. As such, a unique alias must be used to represent the <Collection> being tested.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

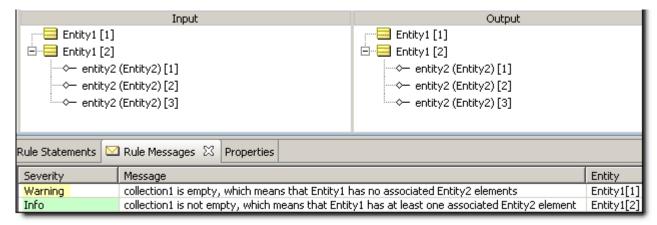

RULESHEET EXAMPLE

This sample Rulesheet uses is Empty to determine if collection1 has any elements. Note the use of unique alias collection1 to represent the collection of Entity2 associated with Entity1.

SAMPLE RULETEST

A sample Ruletest provides two example collection1. The following illustration shows Input and Output panels

Iterate

SYNTAX

<Collection> ->iterate(<Expression>)

DESCRIPTION

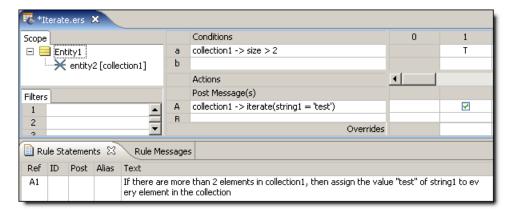

Executes <Expression> for every element in <Collection>. <Collection> must be expressed as a unique alias.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction does not apply. Special exceptions: **iterate** may <u>only</u> be used in Action Rows (section 5 in Sections of Rulesheet that correlate with usage restrictions).

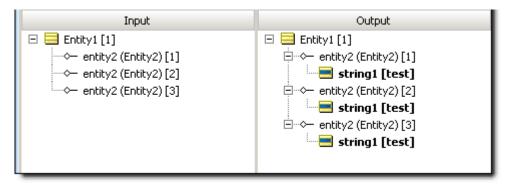

RULESHEET EXAMPLE

This sample Rulesheet uses iterate to assign the value of test to string1 in every element in collection1. See exists for more information on this operator.

SAMPLE RULETEST

A sample Ruletest provides three elements in collection1. Input and Output panels are shown below.

Last

SYNTAX

<Sequence> ->last.<Attribute1>

DESCRIPTION

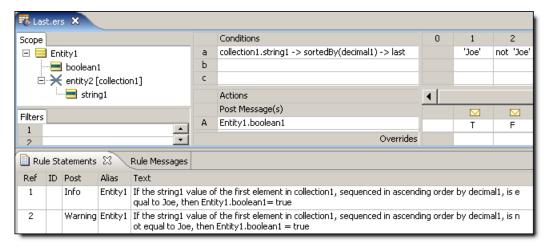

Returns the value of Attribute1 of the last element in Sequence. Another operator, such as sortedBy, must be used to transform a Collection into a Sequence before last may be used. Sequence must be expressed as a unique alias. Attribute1 may be of any data type. See Advanced Collection Syntax for more examples of usage.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

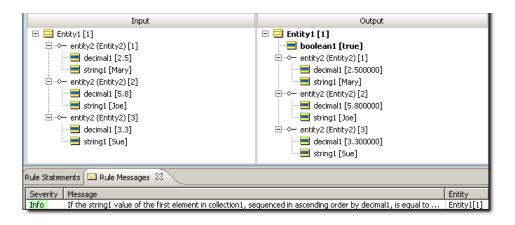

RULESHEET EXAMPLE

This sample Rulesheet uses **last** to identify the last element of the sequence created by applying sortedBy to collection1. Once identified, the value of the string1 attribute belonging to this last element is evaluated. If the value of string1 is Joe, then boolean1 attribute of Entity1 is assigned the value of true.

SAMPLE RULETEST

A sample Ruletest provides a collection of three elements, each with a decimal1 value. Input and Output panels are shown below.

Less than

SYNTAX

DateTime*	<pre><datetime1> < <datetime2></datetime2></datetime1></pre>
Number*	<number1> < <number2></number2></number1>
String	<string1> < <string2></string2></string1>

DESCRIPTION

DateTime*	Returns a value of true if <datetime1> is less than <datetime2>. This is equivalent to <datetime1> occurring "before" <datetime2></datetime2></datetime1></datetime2></datetime1>
Number	Returns a value of true if <number1> is less than <number2>. Different numeric data types may be compared in the same expression.</number2></number1>
String	Returns a value of true if <string1> is less than <string2>. Corticon Studio uses Character precedence: Unicode & Java Collator on page 189.</string2></string1>

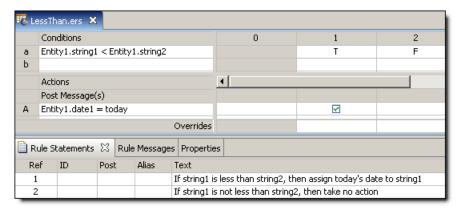

^{*}includes DateTime, Date, or Time data types

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies, with the following exception: **less than** may also be used in Conditional Value Sets & Cells (section 5 in Sections of Rulesheet: Numbers Correlate with Table Above).

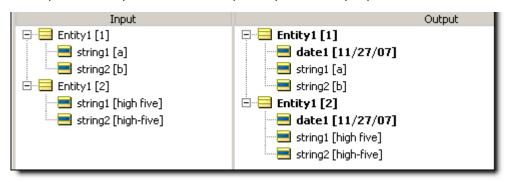

RULESHEET EXAMPLE

The following Rulesheet uses **less than** to test whether string1 is less than string2, and assign today's date to dateTime1 if it is. See today for an explanation of this literal term.

SAMPLE RULETEST

A sample Ruletest provides two examples. Input and Output panels are shown below:

Less than or equal to

SYNTAX

DateTime*	<pre><datetime1> <= <datetime2></datetime2></datetime1></pre>
Number*	<number1> <= <number2></number2></number1>
String	<string1> <= <string2></string2></string1>

DESCRIPTION

DateTime*	Returns a value of true if <datetime1> is less than or equal to <datetime2>. This is equivalent to <datetime1> occurring "on or before" <datetime2></datetime2></datetime1></datetime2></datetime1>
Number	Returns a value of true if <number1> is less than or equal to <number2>. Different numeric data types may be compared in the same expression.</number2></number1>
String	Returns a value of true if <string1> is less than or equal to <string2>. Corticon Studio uses Character precedence: Unicode & Java Collator on page 189.</string2></string1>

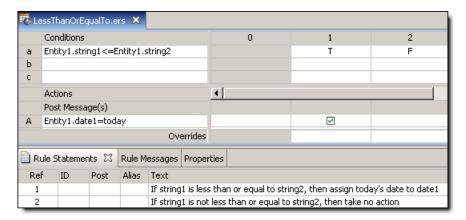

^{*}includes DateTime, Date, or Time data types

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies, with the following exception: **less than or equal to** may also be used in Conditional Value Sets & Cells (section 5 of Sections of Rulesheet that correlate with usage restrictions).

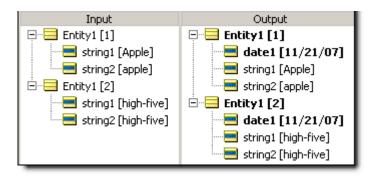

RULESHEET EXAMPLE

The following Rulesheet uses **less than or equal to** to test whether string1 is less than or equal to string2, and assign today's date to dateTime1 if it is. See today for an explanation of this literal term.

SAMPLE RULETEST

A sample Ruletest provides two examples. Input and Output panels are shown below:

Logarithm (Base 10)

SYNTAX

<Number>.log

DESCRIPTION

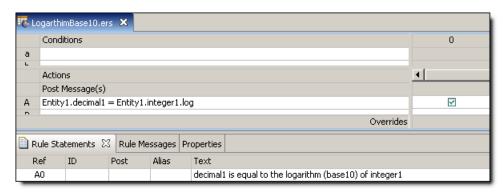

Returns a Decimal value equal to the logarithm (base 10) of <Number>. If <Number> is equal to 0 (zero) an error is returned when the rule is executed.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

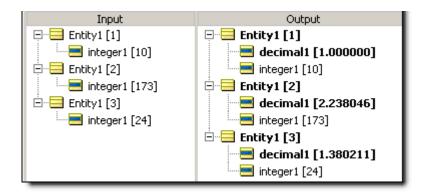

RULESHEET EXAMPLE

The following Rulesheet uses .log to calculate the logarithm (base 10) of integer1 and assign it to decimal1.

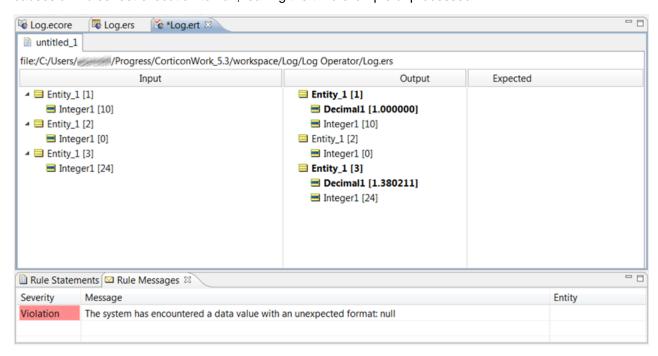

SAMPLE RULETEST 1

A sample Ruletest provides results for three examples of integer1. Input and Output panels are shown below:

SAMPLE RULETEST 2

Another sample Ruletest for three examples of integer1 where one example is equal to zero (0). The resulting error is illustrated below. Notice that the error encountered in the second example causes all Rulesheet execution to halt, leaving the third example unprocessed.

Logarithm (Base x)

SYNTAX

<Number>.log(<Decimal>)

DESCRIPTION

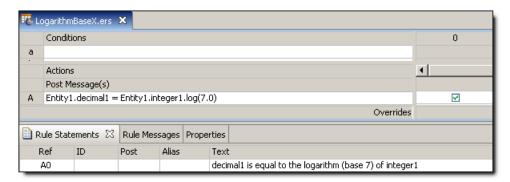

Returns a Decimal value equal to the logarithm (base Decimal>) of Number>. If Number> is equal to 0 (zero) an error is returned when the rule is executed.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

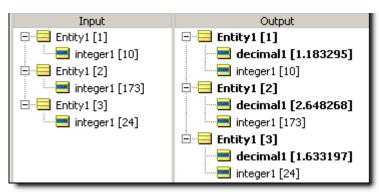

RULESHEET EXAMPLE

The following Rulesheet uses .log to calculate the logarithm (base 7.0) of integer1 and assign it to decimal1.

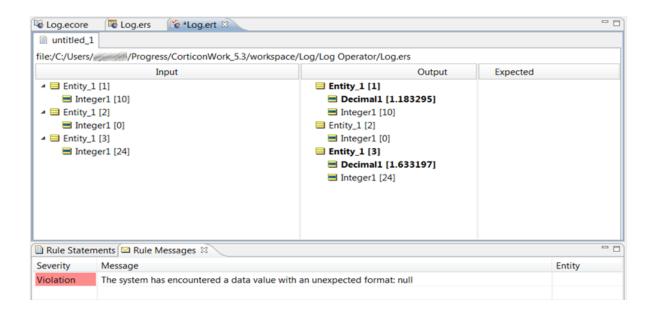

SAMPLE RULETEST 1

A sample Ruletest provides results for three examples of integer1. Input and Output panels are shown below:

SAMPLE RULETEST 2

Another sample Ruletest for three examples of integer1 where one example is equal to zero (0). The resulting error is illustrated below.

Lowercase

SYNTAX

<String>.toLower

DESCRIPTION

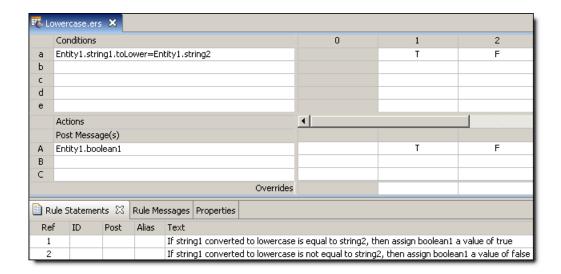

Converts all characters in <String> to lowercase characters.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

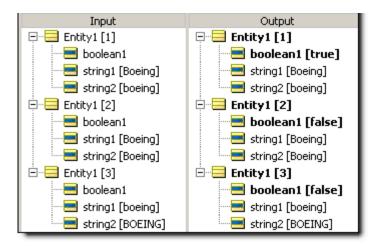

RULESHEET EXAMPLE

The following Rulesheet uses .toLower to convert string1 to lowercase, compare its value with string2, and assign a value to boolean1 based on the results of the comparison.

SAMPLE RULETEST

A sample Ruletest provides three examples of string1 and string2. Input and Output panels are shown below:

Maximum value

SYNTAX

<Number1>.max(<Number2>)

DESCRIPTION

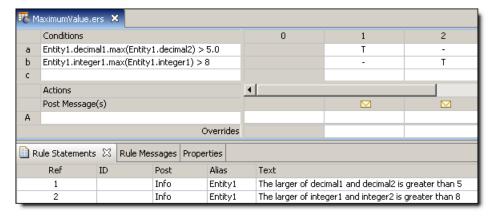

Returns either <Number1> or <Number2>, whichever is greater.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

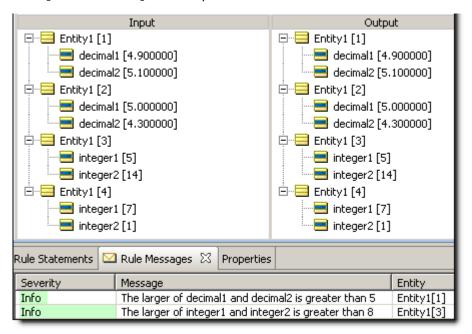

RULESHEET EXAMPLE

The following Rulesheet uses .max to compare the values of decimal1 and decimal2, and integer1 and integer2, and posts a message based on their size relative to 5.0 and 8, respectively.

SAMPLE RULETEST

A sample Ruletest provides four examples, two using decimal1 and decimal2, and two using integer1 and integer2 as input data.

Maximum value (Collection)

SYNTAX

<Collection.attribute> -> max

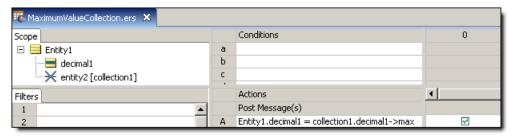

Returns the highest value of <attribute> for all elements in <Collection>. <attribute> must be a numeric data type. <Collection> must be expressed as a unique alias.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

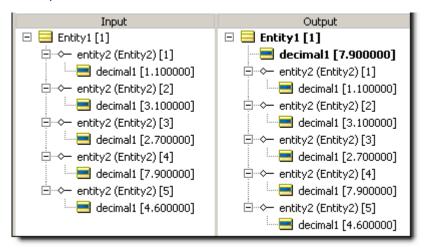

RULESHEET EXAMPLE

The following Rulesheet uses max to identify the highest value of decimal1 in all elements of collection1, then assign it to Entity1.decimal1.

SAMPLE RULETEST

A sample collection contains five elements, each with a value of decimal1.

Minimum value

SYNTAX

<Number1>.min(<Number2>)

DESCRIPTION

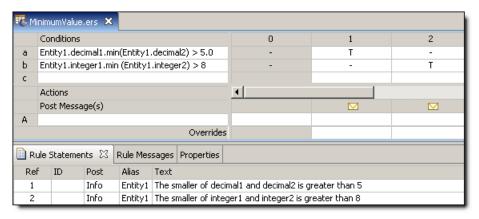

Returns either <Number1> or <Number2>, whichever is smaller.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

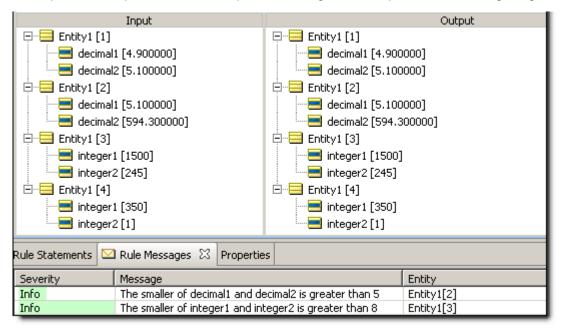

RULESHEET EXAMPLE

The following Rulesheet uses .min to compare the values of decimal1 and decimal2, and integer1 and integer2, and posts a message based on their size relative to 5.0 and 8, respectively.

SAMPLE RULETEST

A sample Ruletest provides four examples, two using decimal inputs, and two using integers.

Minimum value (Collection)

SYNTAX

<Collection.attribute> -> min

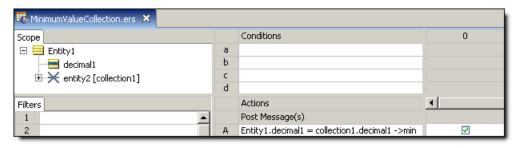

Returns the lowest value of <attribute> for all elements in <Collection>. <attribute> must be a numeric data type. <Collection> must be expressed as a unique alias.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

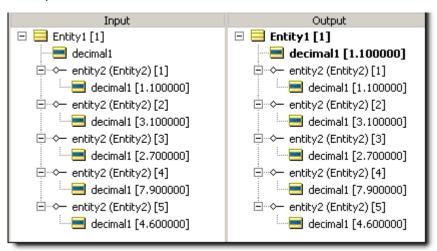

RULESHEET EXAMPLE

The following Rulesheet uses **min** to identify the lowest value of decimal1 in all elements of collection1, then assign it to Entity1.decimal1.

SAMPLE RULETEST

A sample collection contains five elements, each with a value of decimal1.

Minute

SYNTAX

<DateTime>.min
<Time>.min

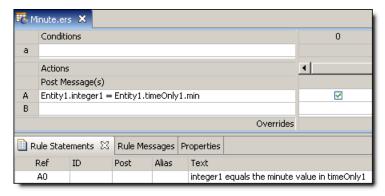

Returns the minute portion of <DateTime> or <Time> as an Integer between 0 and 59. This operator cannot be used with Date attributes because no time information is present.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

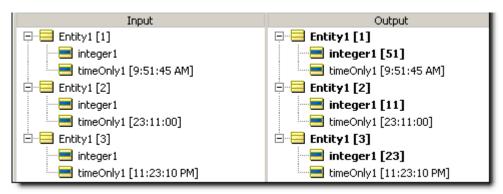

RULESHEET EXAMPLE

The following Rulesheet uses .min to evaluate dateTime1 and assign the minute value to integer1.

SAMPLE RULETEST

A sample Ruletest provides three examples of dateTime1. Input and Output panels are shown below:

Minutes between

SYNTAX

<DateTime1>.minsBetween(<DateTime2>)

<Time1>.minsBetween(<Time2>)

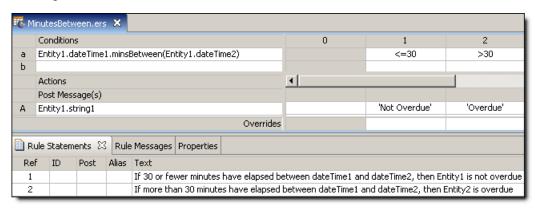

Returns the Integer number of minutes between DateTimes or between Times. The function calculates the number of milliseconds between the two dates and divides that number by 60,000 (the number of milliseconds in a minute). The decimal portion is then truncated. If the two dates differ by less than a full minute, the returned value is zero. This function returns a positive number if <DateTime2> is later than <DateTime1>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

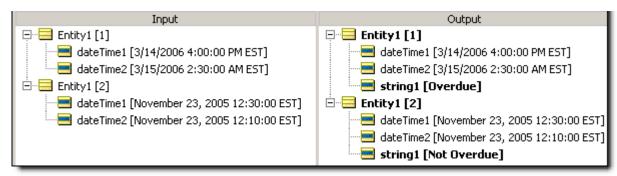

RULESHEET EXAMPLE

The following Rulesheet uses .minsBetween to determine the number of minutes that have elapsed between dateTime1 and dateTime2, compare it to the Values set, and assign a value to string1.

SAMPLE RULETEST

A sample Ruletest provides <code>dateTime1</code> and <code>dateTime2</code> for two examples. Input and Output panels are shown below. Notice the different masks (formats) used for the DateTime data.

Mod

SYNTAX

<Integer1>.mod(<Integer2>)

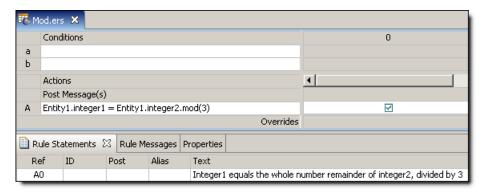

Returns the whole number remainder that results from dividing <Integer1> by <Integer2>. If the remainder is a fraction, then 0 (zero) is returned.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

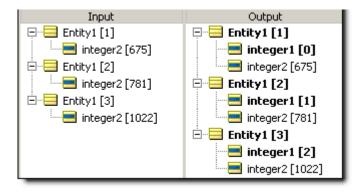

RULESHEET EXAMPLE

The following Rulesheet > uses .mod to calculate the whole number remainder resulting from the division of integer2 by 3. The result is assigned to integer1.

SAMPLE RULETEST

A sample Ruletest provides three examples of integer2. Input and Output panels are shown below.

Month

SYNTAX

<DateTime>.month

<Date>.month

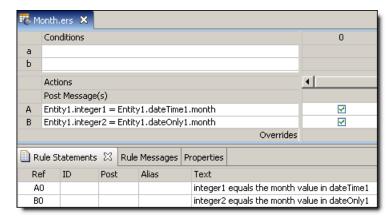

Returns the month in DateTime> or Date> as an Integer between 1 and 12.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

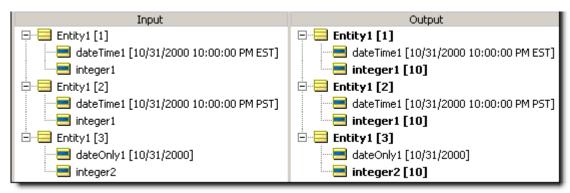

RULESHEET EXAMPLE

The following Rulesheet uses .month to evaluate dateTime1 and dateOnly1 and assign the month value to integer1 and integer2, respectively.

SAMPLE RULETEST

A sample Ruletest provides three examples of dateTime1 or dateOnly1. Input and Output panels are shown below. The month returned is independent of the machine running the Ruletest and only depends on the locale/timezone of the data itself.

Months between

SYNTAX

<DateTime1>.monthsBetween(<DateTime2>)

<Date1>.monthsBetween(<Date2>)

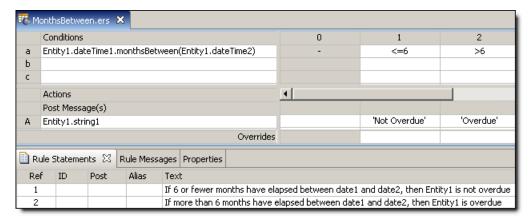

Returns the Integer number of months between DateTimes or between Dates. The month and year portions of the date data are subtracted to calculate the number of elapsed months. The day portions are ignored. If the month and year portions are the same, the result is zero. This function returns a positive number if <DateTime2> is later than <DateTime1>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

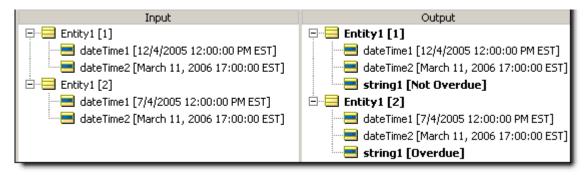

RULESHEET EXAMPLE

The following Rulesheet uses .monthsBetween to determine the number of months that have elapsed between dateTime1 and dateTime2, compare it to the values in the Condition Cells, and assign a value to string1.

SAMPLE RULETEST

A sample Ruletest provides <code>dateTime1</code> and <code>dateTime2</code> for two examples. Input and Output panels are shown below. Notice the variations in date masks (formats).

Multiply

SYNTAX

<Number1> * <Number2>

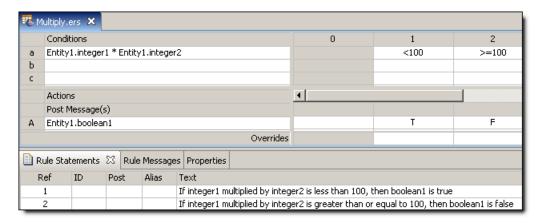

Multiplies <Number1> by <Number2>. The resulting data type is the more expansive of those of <Number1> and <Number2>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

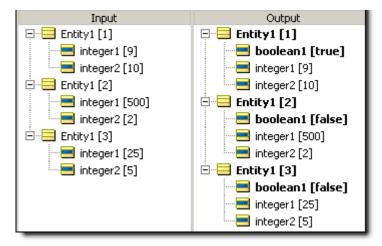

RULESHEET EXAMPLE

This sample Rulesheet uses multiply to multiply integer1 and integer2 and compare the result to 100

SAMPLE RULETEST

A sample Ruletest provides three examples of integer1 and integer2. Input and Output panels are shown below.

Natural logarithm

SYNTAX

<Number>.ln

DESCRIPTION

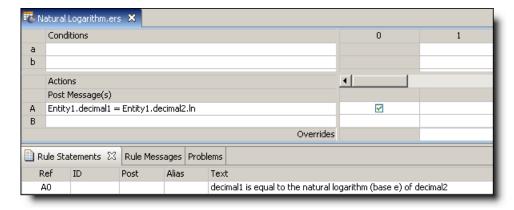

Returns a Decimal value equal to the natural logarithm (base e) of <Number>. If <Number> is equal to 0 (zero), an error is returned when the rule is executed. This error will halt execution for all data present.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

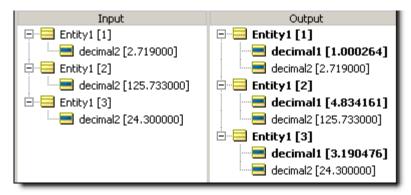

RULESHEET EXAMPLE

The following Rulesheet uses .In to calculate the natural logarithm of decimal2 and assign it to decimal1.

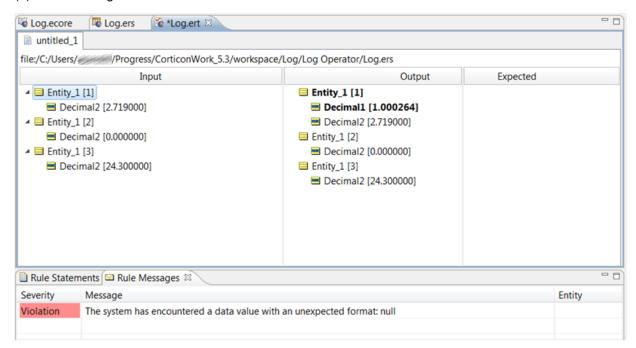

SAMPLE RULETEST 1

A sample Ruletest provides results for three examples of decimal2. Input and Output panels are shown below:

SAMPLE RULETEST 2

Another sample Ruletest for three examples of decimal2 where one example is equal to zero (0). The resulting error is illustrated below:

New

SYNTAX

<Entity>.new[<Expression1>,<Expression2>...]

DESCRIPTION

creates a new <Entity> with attribute values defined by optional <Expression>. Expressions (when present) should be written as assignments in the form: attribute = value. The attribute used in <Expression> (when present) must be an attribute of <Entity>.

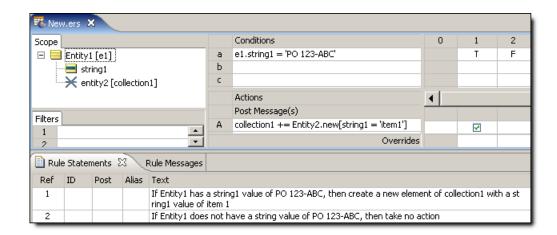

USAGE RESTRICTIONS

The Operators row in the table of Summary Table of Vocabulary Usage Restriction does not apply. Special exceptions: **new** may <u>only</u> be used in Action Rows (section 5 in Sections of Rulesheet that correlate with usage restrictions).

AND logic, expressed as commas between <Expressions>, is supported within the square brackets [..]. **OR** logic is not supported within the square brackets [..].

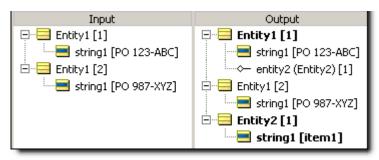

RULESHEET EXAMPLE

The following Rulesheet uses .new to create a new Entity2 element in collection1 when Entity1 has a string1 value equal to "PO 123-ABC". An alias is not required by the .new operator, because it is possible to create a new entity at the root level, without inserting it into a collection. The collection alias used here is required by the += (Associate Element to collection) operator.

SAMPLE RULETEST

A sample Ruletest provides 2 collections of Entity1. Input and Output panels are illustrated below:

New unique

SYNTAX

<Entity>.newUnique[<Expression1>,<Expression2>...]

DESCRIPTION

newUnique is an unusual operator in that it contains both action *and* condition logic. When an Action containing this operator is executed, a new <Entity> will be created <u>only if</u> no other entity exists with the characteristics defined by <Expression1> **and** <Expression2>, etc. <Expression1> and <Expression2> are optional. If no expression is present within the square brackets [..], the **newUnique** operator will create a new entity only if none currently exists in memory.

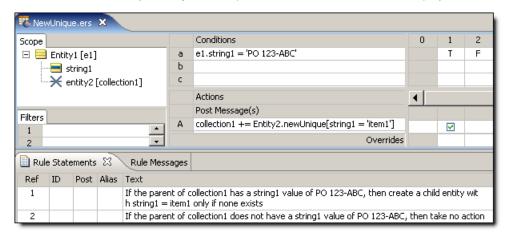

USAGE RESTRICTIONS

The Operators row in the table of Summary Table of Vocabulary Usage Restriction does not apply. Special exceptions: **newUnique** may <u>only</u> be used in Action Rows (section 5 in Sections of Rulesheet that correlate with usage restrictions).

AND logic, expressed as commas between <Expressions>, is supported within the square brackets [..]. **OR** logic is not supported within the square brackets [..].

RULESHEET EXAMPLE

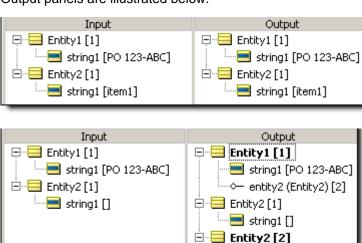

The following Rulesheet uses .newUnique to create a new Entity2 element with string1="item1", and add it to collection1 only if no existing Entity2 already has string1="item1". A collection alias is not required by the .newUnique operator because it is possible to create a new entity at the root level, without inserting it into a collection. The collection alias used here is required by the += (Associate Element to collection) operator.

SAMPLE RULETEST 1

Each of three sample tests provides different combinations of Entity1 and Entity2. Input and Output panels are illustrated below:

string1 [item1]

Not

SYNTAX

not <Expression>

DESCRIPTION

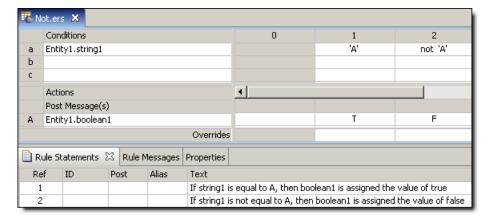

Returns the negation of the truth value of <Expression>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies, with the following special exception: **not** may also be used in Conditional Cells.

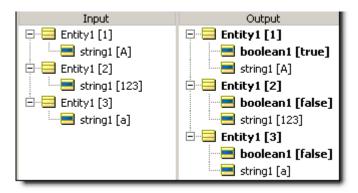

RULESHEET EXAMPLE

The following Rulesheet uses **not** to negate the value of A in the Condition Cell of rule 2. **Not** may only be used in this manner if there is at least one other value (including other or null) present in the Condition Cells values drop-down list (i.e., there must be at least one alternative to the value negated by **not**).

SAMPLE RULETEST

A sample Ruletest provides three examples of string1. Input and Output panels are shown below:

Not empty

SYNTAX

<Collection> ->notEmpty

DESCRIPTION

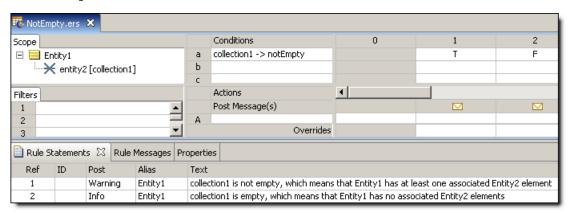

Returns a value of true if <Collection> contains at least one element. ->notEmpty does not check for attribute values, but instead checks for the existence of elements within a collection. As such, it requires the use of a unique alias to represent the collection being tested.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

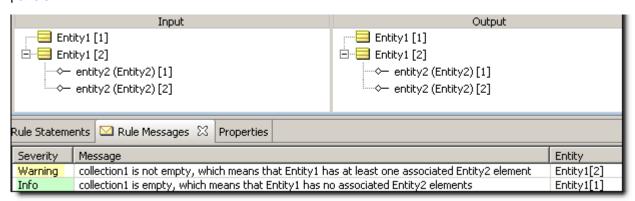

RULESHEET EXAMPLE

This sample Rulesheet uses the **notEmpty** function to determine if collection1 has elements. Note the use of unique alias collection1 to represent the collection of Entity2 associated with Entity1.

SAMPLE RULETEST

A sample Ruletest provides two collections. The following illustration shows Input and Output panels

Not equal to

SYNTAX

Boolean	<expression1> <> <expression2></expression2></expression1>
DateTime*	<pre><datetime1> <> <datetime2></datetime2></datetime1></pre>
Number	<number1> <> <number2></number2></number1>
String	<string1> <> <string2></string2></string1>

DESCRIPTION

Boolean	Returns a value of true if <expression1> does not have the same truth value as <expression2>.</expression2></expression1>
DateTime*	Returns a value of true if <datetime1> does not equal <datetime2>. This is equivalent to <datetime1> not occurring "on" <datetime2></datetime2></datetime1></datetime2></datetime1>
Number	Returns a value of true if <number1> is not equal to <number2>. Different numeric data types may be compared in the same expression.</number2></number1>
String	Returns a value of true if <string1> is not equal to <string2>. Studio uses Character precedence: Unicode & Java Collator on page 189 to determine character precedence.</string2></string1>

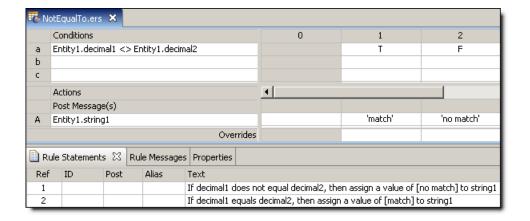

^{*}includes DateTime, Date, and Time data types

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

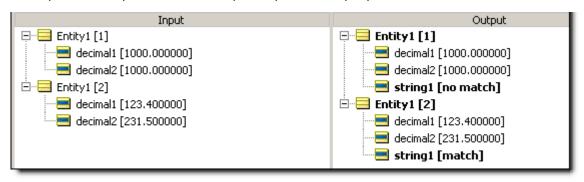

RULESHEET EXAMPLE

The following Rulesheet uses not equal to to test whether decimal1 equals decimal2, and assign a value to string1 based on the result of the comparison.

SAMPLE RULETEST

A sample Ruletest provides two examples. Input and Output panels are shown below:

Now

SYNTAX

now

DESCRIPTION

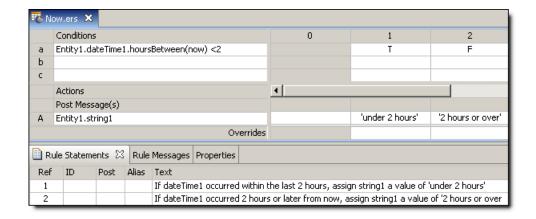

Returns the current system date and time when the rule is executed. This DateTime value is assigned the first time **now** is used in a Decision Service (Rule Set), then remains constant until the Decision Service finishes execution, regardless of how many additional times it is used. This means that every rule in a Rule Set containing **now** will use the same DateTime value.

USAGE RESTRICTIONS

The Literals row in the table of Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

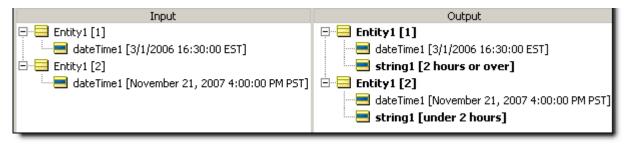

RULESHEET EXAMPLE

The following Rulesheet uses **now** to determine how many hours have elapsed between now and dateTime1 (see .hoursBetween for more details on this operator), and assign a value to string1 based on the result.

SAMPLE RULETEST

A sample Ruletest provides two examples of dateTime1. Assume **now** is equal to Thursday, March 16,2006 8:50:00 AM EST. Input and Output panels are shown below. Notice the variation in DateTime masks (formats).

Null

SYNTAX

null

DESCRIPTION

The null value corresponds to one of three different scenarios:

- 1. the absence of an attribute in a Ruletest Input pane or request message
- 2. the absence of data for an attribute in a Ruletest (the value zero counts as data)
- 3. a business object (supplied by an external application) that has an instance variable of null

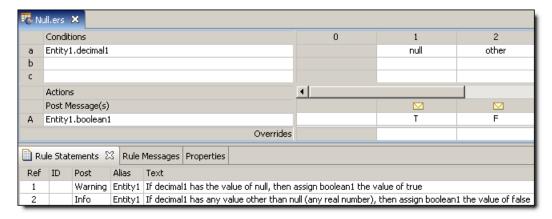

A **null** value is different from an empty String (for String data types) or zero for numeric data types. An empty String is represented in a Ruletest as [] -- open then close square brackets. Any attribute value, including any empty strings, may be reset to **null** in a Ruletest by right-clicking the attribute and choosing **Set to null**. Mandatory attributes (property set in the Vocabulary) may not have a null value.

USAGE RESTRICTIONS

The Literals row in the table of Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

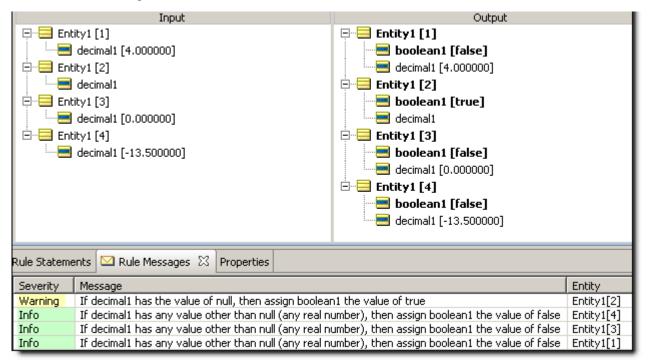

RULESHEET EXAMPLE

The following Rulesheet uses **null** to test for the existence of a real value in decimal1, and assign a value to boolean1 as a result.

SAMPLE TEST

A sample Ruletest provides four examples of decimal1. Input and Output panels are illustrated below. Posted messages are not shown.

Other

132

SYNTAX

other

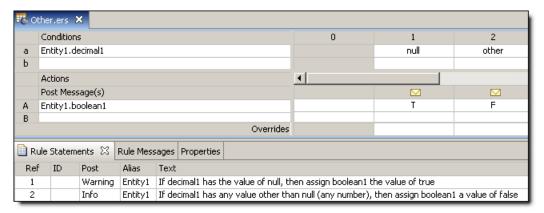

When included in a condition's Values set (the drop-down list of values available in a Conditions Cell), **other** represents any value not explicitly included in the set, including null. If null is explicitly included in the Values set, then **other** does not include null.

USAGE RESTRICTIONS

The Literals row in the table of Summary Table of Vocabulary Usage Restriction does not apply. Special exception: **other** may <u>only</u> be used in Condition Cells (section 4 of the Sections of Rulesheet that correlate with usage restrictions) because it is a non-specific value used in comparisons.

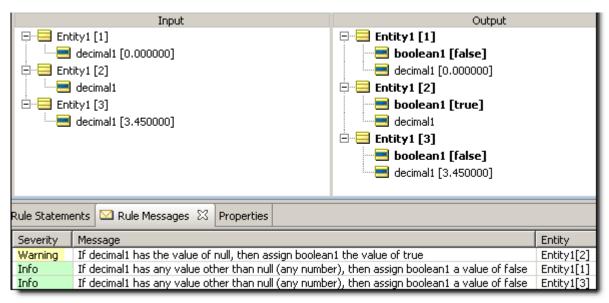

RULESHEET EXAMPLE

The following Rulesheet uses other to test the value of decimal1. If decimal1 has any value other than null, boolean1 is assigned the value of false.

SAMPLE TEST

A sample Ruletest provides three examples of decimal1. Ruletest Input and Output panels are shown below:

Or

SYNTAX

<Expression1> or <Expression2> or

OR may also be used with ->forAll and ->exists expressions

DESCRIPTION

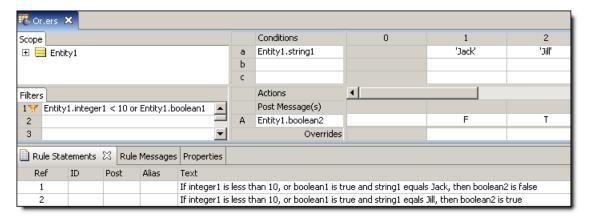

Returns a value of true if either <Expression1> or <Expression2> evaluates to true. When used between two or more expressions in the Preconditions section, creates a compound filter for the Rulesheet that follows. See *Rule Modeling Guide* for details on using Preconditions as filters. **OR** is not available in the Conditions section because the logical **OR** construction is implemented using multiple Columns in the decision table, or by value sets in Conditions Cells.

USAGE RESTRICTIONS

The Literals row in the table of Sections of Rulesheet that correlate with usage restrictions does not apply. Special exception: **or** may only be used in the Filters section of the Rulesheet to join 2 or more expressions, as shown above, or within ->forAll and ->exists expressions as described in those sections.

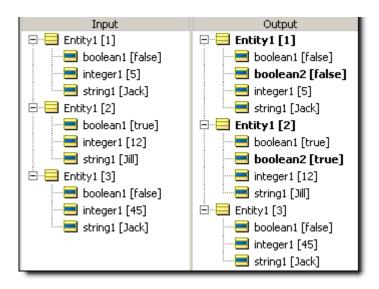

RULESHEET EXAMPLE

The following Rulesheet uses or to test the value of integer1, boolean1, and string1 to set the value of boolean2

SAMPLE TEST

A sample Ruletest provides three examples. Input and Output panels are shown below:

Remove element

SYNTAX

<Entity>.remove
<Collection>.remove

DESCRIPTION

Removes <Entity> or removes elements from <Collection> and deletes it/them. If removing from a collection, then using a unique alias to represent the collection is optional since .remove is not a collection operator. If any elements in <Collection> have one-to-many associations with other entities, then those entities will also be deleted.

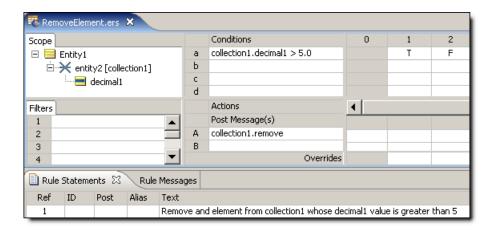

When using **.remove** to delete elements of a collection, associated entities will not be removed. To remove a chain of associated entities, use **.remove** on each level of the association hierarchy, beginning with the last or "lowest" level and working up. For example of this behavior, see example 2 below.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction does not apply. Special exceptions: **.remove** may <u>only</u> be used in Action Rows (section 5 in Sections of Rulesheet that correlate with usage restrictions).

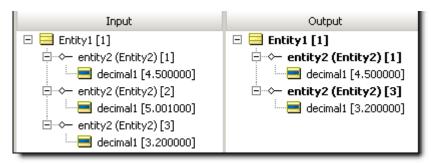

RULESHEET EXAMPLE

This Rulesheet uses the operator to remove elements from collection1 whose decimal1 value is greater than 5. Note the *optional* use of unique alias collection1 to represent the collection of Entity2 elements associated with Entity1.

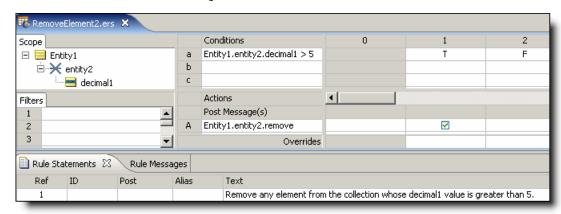

SAMPLE TEST

A sample Ruletest provides a collection with two elements. The illustration shows Ruletest Input and Output panels

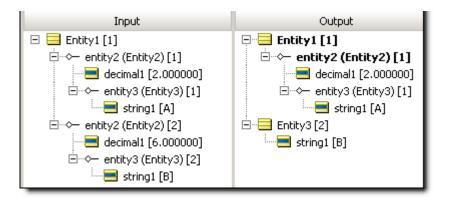

RULESHEET EXAMPLE 2

This Rulesheet uses the operator to remove elements from Entity1.entity2 whose decimal1 value is greater than 5. Note no unique alias has been used to represent the collection of Entity2 elements associated with Entity1.

SAMPLE RULETEST 2

A sample Ruletest provides an <code>Entity1</code> with two <code>entity2</code>, each of which has an <code>entity3</code> child of its own. The illustration shows Ruletest Input and Output panels. Note that when an <code>entity2</code> is removed, its associated <code>entity3</code> is moved to the root level.

Replace element(s)

SYNTAX

<Collection1> = <Collection2> <Collection> = <Entity>

DESCRIPTION

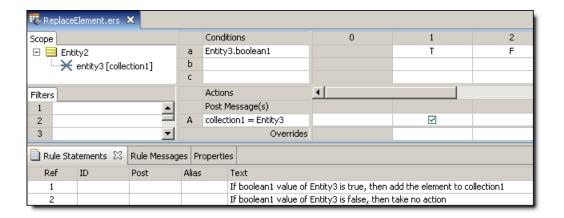

Replaces all elements in <Collection1> with the elements in <Collection2>, provided the association between the two is permitted by the Business Vocabulary. In the second syntax, <Entity> is associated with <Collection>, replacing the <Entity> already associated, when the association between the two is "one-to-one" in the Business Vocabulary. All collections must be expressed as unique aliases.

USAGE RESTRICTIONS

The Operators row in the table of Summary Table of Vocabulary Usage Restriction does not apply. Special exceptions: **replace elements** may <u>only</u> be used in Action Rows (section 5 in Sections of Rulesheet that correlate with usage restrictions).

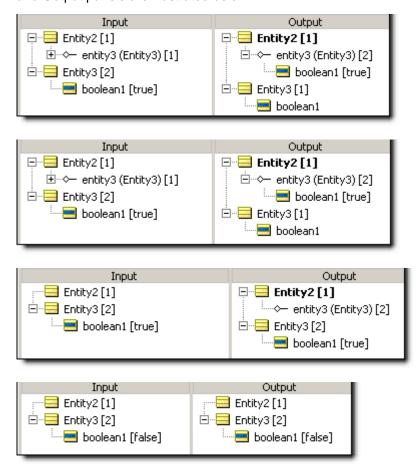

RULESHEET EXAMPLE

This sample Rulesheet uses the **replace element** operator to add Entity3 to collection1 if its boolean1 value is true. Note the use of unique alias collection1 to represent the collection of Entity3 elements associated with Entity2. Recall from the generic Business Vocabulary, shown in Vocabulary used in this Language Guide on page 16, that the association between Entity2 and Entity3 has a cardinality of "one-to-one". This means that if multiple Entity3 are present, only one will be added to collection1.

SAMPLE TEST

Four sample tests provide scenarios of two elements which share a one-to-one association. Input and Output panels are illustrated below:

Round

SYNTAX

<Decimal>.round(<Integer>)

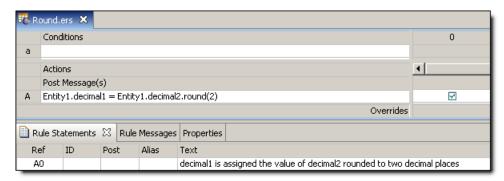

Rounds Rounds Decimal> to the number of decimal places specified by Integer>. Standard rounding
conventions apply, meaning numbers ending with significant digits of 5 or more round up and
numbers ending with significant digits less than 5 round down. Integer> is optional - if no
parameter is specified, then Decimal> rounds to the nearest whole number of type Decimal.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

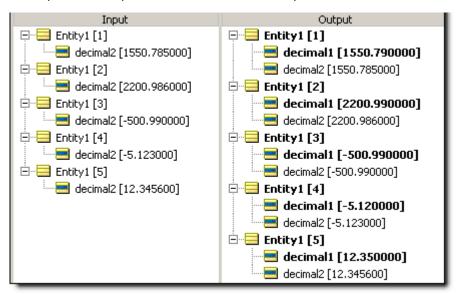

RULESHEET EXAMPLE

The following Rulesheet uses .round to round the value of decimal2 to the 2nd decimal place, and assigns it to decimal1.

SAMPLE TEST

A sample Ruletest provides results for five examples of decimal2.

Second

SYNTAX

<DateTime>.sec

<Time>.sec

DESCRIPTION

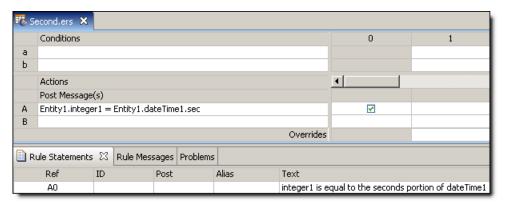

Returns the seconds portion of <DateTime> or <Time>. The returned value is an Integer between 0 and 59.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

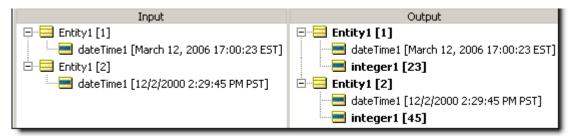

RULESHEET EXAMPLE

The following Rulesheet uses the .sec function to evaluate dateTime1, return the seconds value, and assign it to integer1.

SAMPLE TEST

A sample Ruletest provides results for two examples of dateTime1.

Seconds between

SYNTAX

<DateTime1>.secsBetween(<DateTime2>)
<Time1>.secsBetween(<Time>)

DESCRIPTION

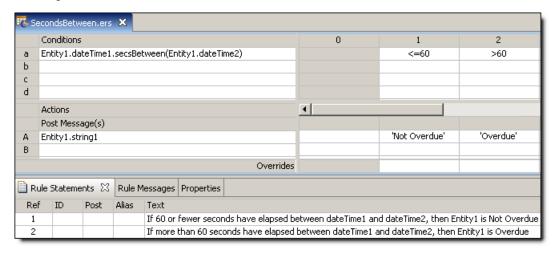

Returns the Integer number of seconds between DateTimes or between Times. The number of milliseconds in <DateTime1> is subtracted from that in <DateTime2>, and the result divided by 1000 (the number of milliseconds in a second). The result is truncated. This function returns a positive number if <DateTime2> is later than <DateTime1>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

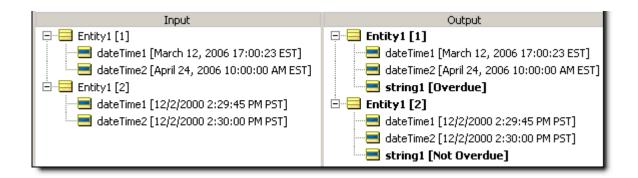

RULESHEET EXAMPLE

The following Rulesheet uses .secsBetween to determine the number of seconds that have elapsed between dateTime1 and dateTime2, compare it to the Values set, and assign a value to string1.

SAMPLE TEST

A sample Ruletest provides dateTime1 and dateTime2 for two examples. Input and Output panels are shown below.

Size of string

SYNTAX

<String>.size

DESCRIPTION

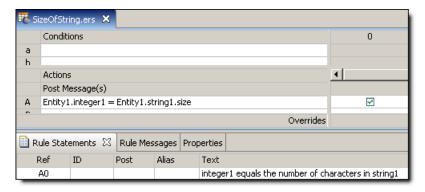

Returns the Integer number of characters in <String>. All characters, numbers, symbols, and punctuation marks are counted, including spaces before, within, and after words.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

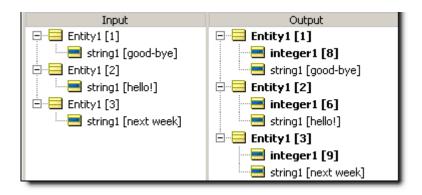

RULESHEET EXAMPLE

The following Rulesheet uses the .size function to determine the length of string1 and assign it to integer1

SAMPLE TEST

A sample Ruletest provides three examples. Input and Output panels are shown below:

Size of collection

SYNTAX

<Collection> ->size

DESCRIPTION

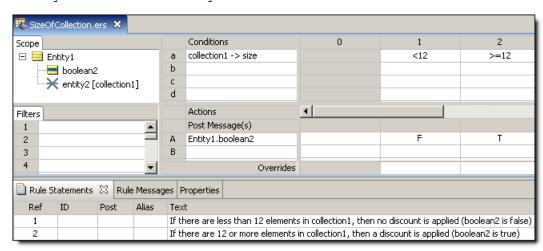

Returns the Integer number of elements in <Collection>. <Collection> must be expressed as a unique alias.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

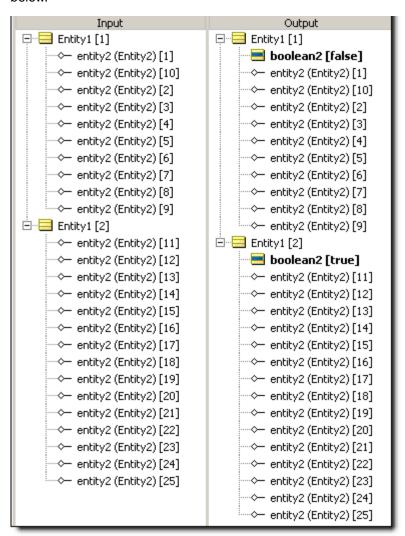

RULESHEET EXAMPLE

This sample Rulesheet uses ->size to count the number of elements in collection1, and assign a value to boolean2. Note the use of unique alias collection1 to represent the collection of Entity2 associated with Entity1.

SAMPLE TEST

A sample Ruletest provides three examples of collection1. Input and Output panels are shown below

Sorted by

SYNTAX

<Collection> ->sortedBy(<Attribute2>) -> sequence operator. <Attribute1>

DESCRIPTION

Sequences the elements of <Collection> in ascending order, using the value of <Attribute2> as the index, and returns the <Attribute1> value of the element in the sequence position determined by the sequence operator. A sequence must be created before any sequence operator (first, last, or at) is used to identify a particular element. <Attribute1> and <Attribute2> must be attributes of <Collection>.

<a href="<"><Attribute2> may be any data type except Boolean. Strings are sorted according to character precedence - see Character precedence: Unicode & Java Collator on page 189. <Collection> must be expressed as a unique alias.

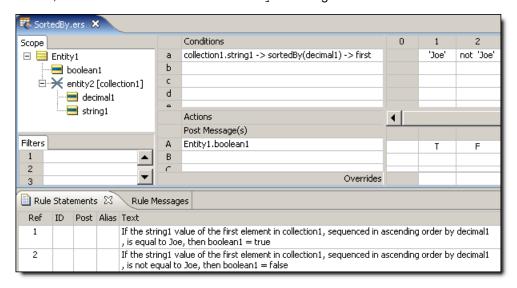

See Advanced Collection Syntax and special statement block syntax for more examples of usage.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

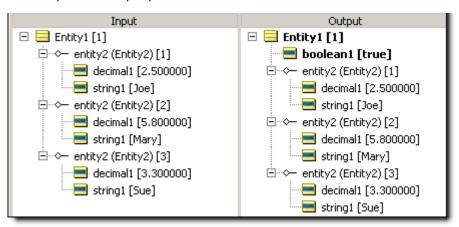

RULESHEET EXAMPLE 1 - USED IN A CONDITION

This sample Rulesheet uses ->sortedBy in a conditional expression to create an ascending sequence from collection with decimal1 as the index. \(\percent{\textit{lirst.string1}}\) is used to return the value of the string1 attribute of the first element of the sequence. If the value of string1 is Joe, then boolean1 attribute of Entity1 is assigned the value of true.

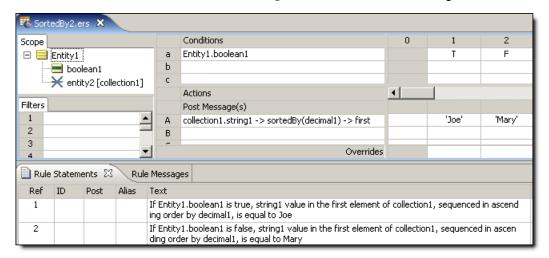

SAMPLE RULETEST 1

A sample Ruletest provides a collection of three elements, each with a decimal1 and string1 value. Input and Output panels are shown below.

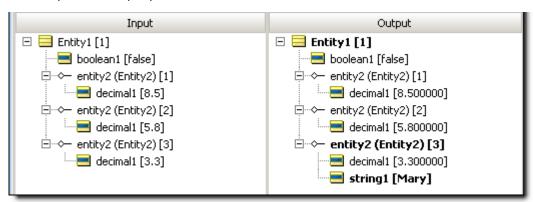

RULESHEET EXAMPLE 2 – USED IN AN ACTION

This sample Rulesheet uses **sortedBy** in an action expression to create an ascending sequence from collection with decimal1 as the index. Dfirst.string1 is used to return the value of the string1 attribute of the first element of the sequence. The value of string1 is assigned the value of Joe if boolean1 attribute of Entity1 is true, if false it is assigned the value of Mary.

SAMPLE RULETEST 2

A sample Ruletest provides a collection of three elements, each with a decimal1 and string1 value. Input and Output panels are shown below.

Sorted by descending

SYNTAX

<Collection> ->sortedByDesc(<Attribute2>) -> sequence operator. <Attribute1>

DESCRIPTION

Sequences the elements of <Collection> in <u>descending</u> order, using the value of <Attribute2> as the index, and returns the <Attribute1> value of the element in the sequence position determined by the sequence operator. A sequence must be created before any sequence operator (first, last, or at) is used to identify a particular element. <Attribute1> and <Attribute2> must be attributes of <Collection>.

<a href="<a href=" <a href=" Attribute2 may be any data type except Boolean. Strings are sorted according to their ISO character precedence - see Character precedence: Unicode & Java Collator on page 189. <a href="<a href="<a

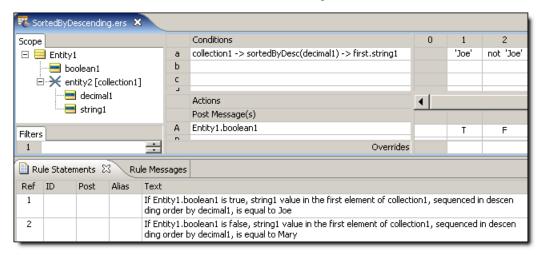

See Advanced Collection Syntax and special statement block syntax for more examples of usage.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

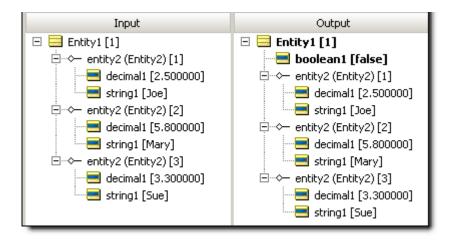

RULESHEET EXAMPLE 1 - USED IN A CONDITION

This sample Rulesheet uses -> sortedByDesc in a conditional expression to create an descending sequence from collection with decimal1 as the index. \(\precent{\text{first.string1}} \) is used to return the value of the string1 attribute of the first element of the sequence. If the value of string1 is Joe, then boolean1 attribute of Entity1 is assigned the value of true.

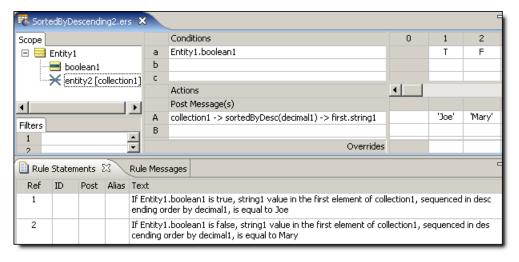

SAMPLE RULETEST 1

A sample Ruletest provides a collection of three elements, each with a decimal1 value. Input and Output panels are shown below.

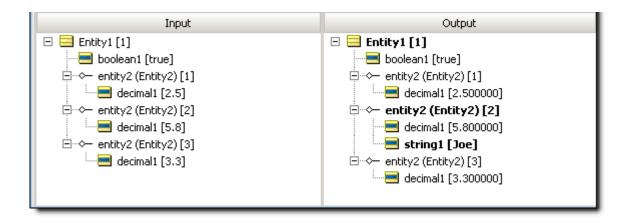

RULESHEET EXAMPLE 2 – USED IN AN ACTION

This sample Rulesheet uses **sortedByDesc** in an action expression to create an descending sequence from collection with decimal1 as the index. \square first.string1 is used to return the value of the string1 attribute of the first element of the sequence. The value of string1 is assigned the value of Joe if boolean1 attribute of Entity1 is true, if false it is assigned the value of Mary.

SAMPLE RULETEST 2

A sample Ruletest provides a collection of three elements, each with a decimal1 value. Input and Output panels are shown below.

Starts with

SYNTAX

<String1>.startsWith(<String2>)

DESCRIPTION

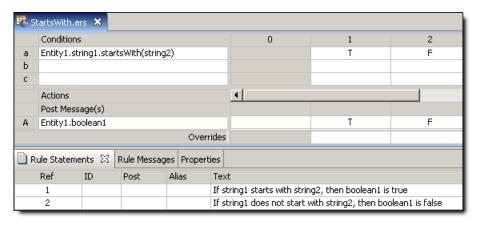

Returns a value of true if <String1> begins with the characters specified in <String2>. Comparisons are case-sensitive.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

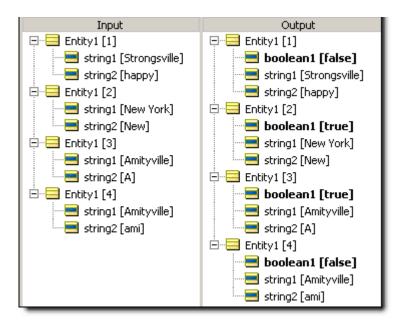

RULESHEET EXAMPLE

The following Rulesheet uses .startsWith to evaluate whether string1 begins with the value of string2 and assigns a different value to boolean1 for each outcome.

SAMPLE TEST

A sample Ruletest provides string1 and string2 values for four examples. Input and Output panels are shown below.

Substring

SYNTAX

<String>.substring(<Integer1>, <Integer2>)

DESCRIPTION

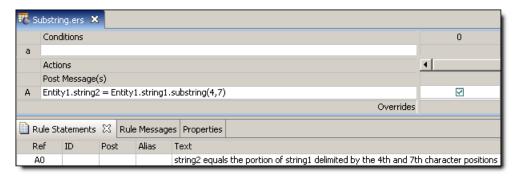

Returns the portion of String> beginning with the character in position <Integer1> and ending
with the character in position <Integer2>. The number of characters in String> must be at
least equal to <Integer2>, otherwise an error will be produced. Both <Integer1> and
<Integer2> must be positive integers, and <Integer2> must be greater than <Integer1>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

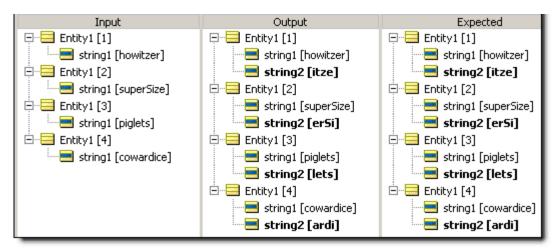

RULESHEET EXAMPLE

This sample Rulesheet uses .substring to return those characters of string1 between positions 4 and 7 (inclusive), and assign the resulting value to string2.

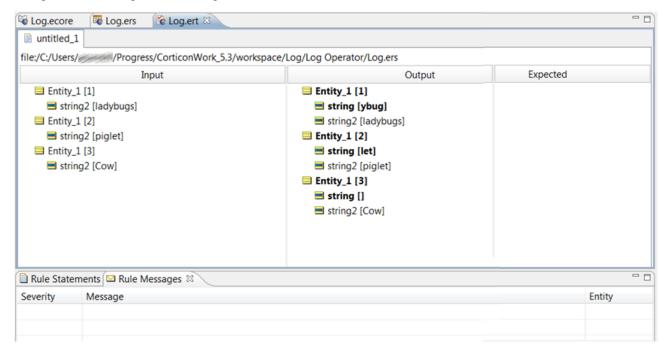

SAMPLE RULETEST 1

A sample Ruletest provides string1 values for four examples. Input and Output panels are shown below.

SAMPLE RULETEST 2

Another sample Ruletest shows string1 values with two examples having insufficient character strings. The resulting error message is illustrated below:

Subtract

SYNTAX

<Number1> - <Number2>

DESCRIPTION

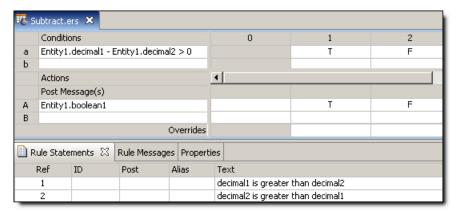

Subtracts the value of <Number2> from that of <Number1>. The resulting data type is the more expansive of those of <Number1> and <Number2>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

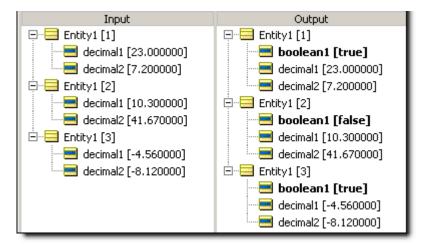

RULESHEET EXAMPLE

This sample Rulesheet uses **subtract** to reduce the value of decimal1 by decimal2, compare the resulting value to zero, and assign a value to boolean1

SAMPLE TEST

A Ruletest provides three examples of decimal1 and decimal2. Input and Output panels are shown below.

Sum

SYNTAX

<Collection.attribute> ->sum

DESCRIPTION

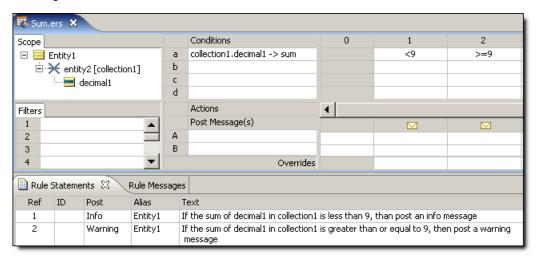

Sums the values of the specified <attribute> for all elements in <Collection>. <attribute> must be a numeric data type. <Collection> must be expressed as a unique alias.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

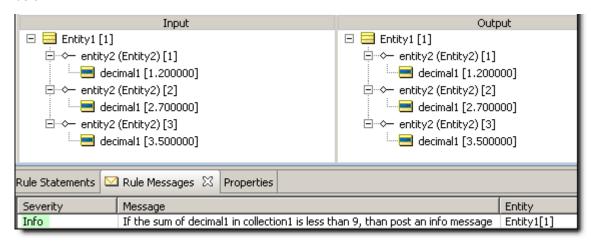

RULESHEET EXAMPLE

This Rulesheet uses the **sum** function to add all decimal1 attributes within collection1. Note the use of unique alias collection1 to represent the collection of Entity2 associated with Entity1

SAMPLE TEST

A sample Ruletest provides 3 elements in collection1. Input and Output panels are shown below.

Today

SYNTAX

today

DESCRIPTION

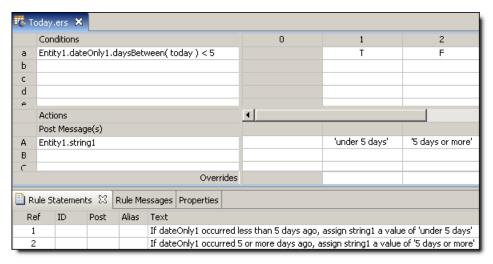

Returns the current system date when the rule is executed. This Date Only value is assigned the first time **today** is used in a Decision Service (Rule Set), then remains constant until the Decision Service finishes execution, regardless of how many additional times it is used. This means that every rule in a Rule Set using **today** will use the same Date Only value. No time portion is assigned

USAGE RESTRICTIONS

The Literals row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

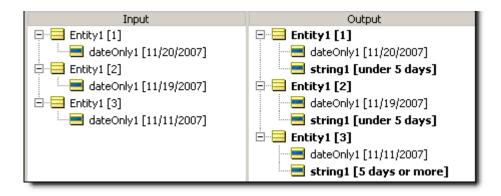

RULESHEET EXAMPLE

The following Rulesheet uses **today** to determine how many days have elapsed between today and dateTime1, and assign a value to string1 based on the result.

SAMPLE TEST

A sample Ruletest provides three examples of dateOnly1. Assume today is equal to Friday, November 23,2007. Input and Output panels are shown below:

To date – casting a dateTime to a date

SYNTAX

<DateTime>.toDate

DESCRIPTION

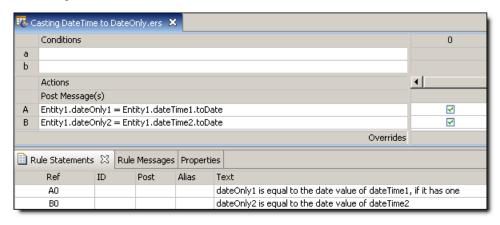

Converts the value in \DateTime> to a Date datatype, containing only the date portion of the DateTime. If \DateTime> contains no date information, then the system epoch is used.

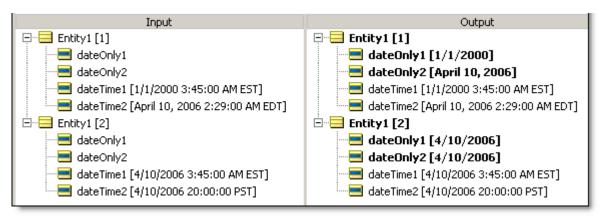

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .toDate to convert dateTime1 and DateTime2 to Date datatypes and assign the values to dateTime1 and dateTime2.

To dateTime – casting a string to a dateTime

SYNTAX

<String>.toDateTime

DESCRIPTION

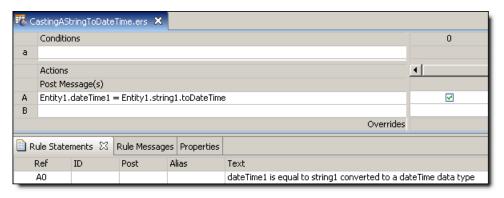

Converts the value in <String> to data type DateTime ONLY if all characters in <String> correspond to a valid Date, Time, or DateTime mask (format). For complete details on DateTime masks, see *Rule Modeling Guide*.

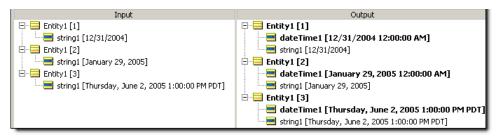

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .toDateTime to convert string1 to type DateTime and assign the value to dateTime1.

To dateTime – casting a date to a dateTime

SYNTAX

<Date>.toDateTime

DESCRIPTION

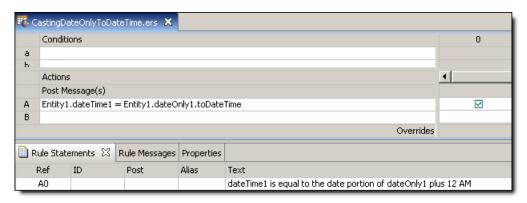

Converts the value in <Date> to data type DateTime. The date portion is the same as the <Date> value and the time portion is set to 12:00:00 AM in the current timezone.

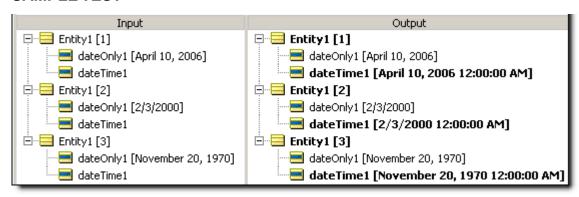

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .toDateTime to convert dateOnly1 to type DateTime and assign the value to dateTime1.

To dateTime – casting a time to a dateTime

SYNTAX

<Time>.toDateTime

DESCRIPTION

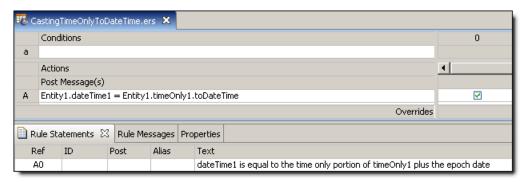

Converts the value in <Time> to data type DateTime ONLY if all characters in <Time> correspond to a valid DateTime mask (format). The time portion is the same as the <Time> value and the date portion is the epoch (see .toTime operator)

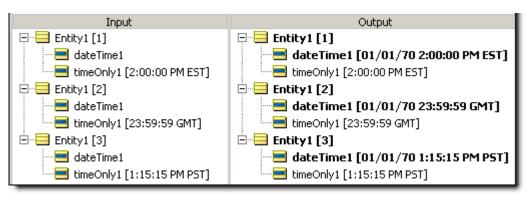

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .toDateTime to convert timeOnly1 to type DateTime and assign the value to dateTime1.

To dateTime – timezone offset

SYNTAX

<Date>.toDateTime(<String>)

DESCRIPTION

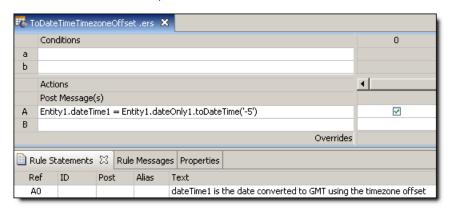

Converts the value in <Date> to data type DateTime ONLY if all characters in <Date> correspond to a valid DateTime mask (format). The date portion is the same as the <Date> value and the time portion is set to 00:00:00 in the timezone specified by <String>, which is the timeZoneOffset. The timeZoneOffset must take the form of a valid timezone offset such as `-08:00', `+03:30', `01:45'

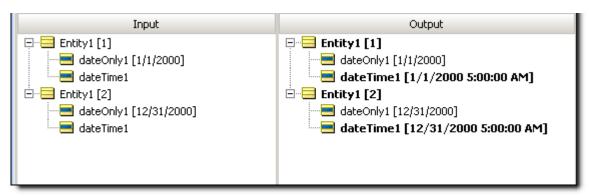

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .toDateTime to convert dateOnly1 to type DateTime and assign the value to dateTime1, with a timezone offset of -5.

To decimal

SYNTAX

<Integer>.toDecimal

<String>.toDecimal

DESCRIPTION

Converts the value in <Integer> or all characters in <String> to data type Decimal. Converts a String to Decimal ONLY if all characters in <String> are numeric and contain not more than one decimal point. If any non-numeric characters are present in <String> (other than the single decimal point or a leading minus sign), no value is returned by the function.

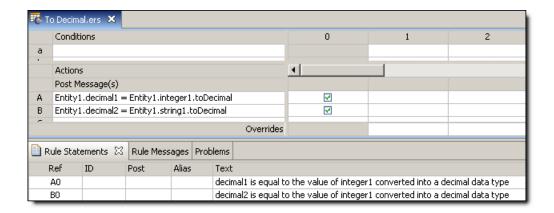

Note: Integer values may be assigned directly to Decimal data types without using the .toDecimal operator because a Decimal data type is more expansive than an Integer.

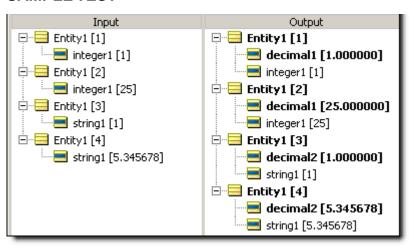

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .toDecimal to convert integer1 and string1 to type Decimal and assign them to decimal1 and decimal2, respectively.

To integer

SYNTAX

<Decimal>.toInteger

<String>.tointeger

DESCRIPTION

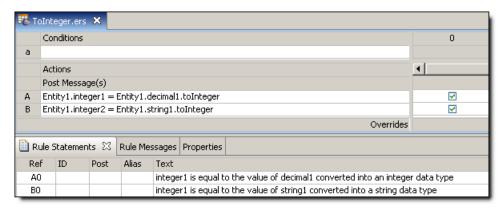

Converts the value in <Decimal> or all characters in <String> to data type Integer. All decimals have fractional portions truncated during the conversion. Strings are converted ONLY if all characters in <String> are numeric, without a decimal point. If any non-numeric characters (with the sole exception of a single leading minus sign for negative numbers) are present in <String>, no value is returned by the function. Do not use on String values of null or empty String (''') -- a pair of single quote marks -- as this will generate an error message.

USAGE RESTRICTIONS

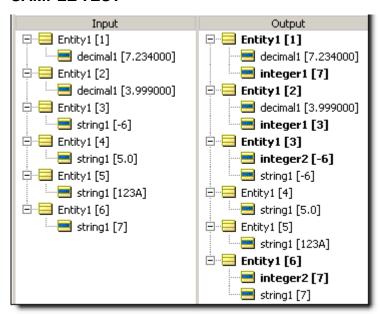

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .toInteger to convert decimal1 and string1 to type Integer and assign them to integer1 and integer2, respectively.

SAMPLE TEST

To string

SYNTAX

<Number>.toString

<DateTime*>.toString

*includes DateTime, Date, and Time data types

DESCRIPTION

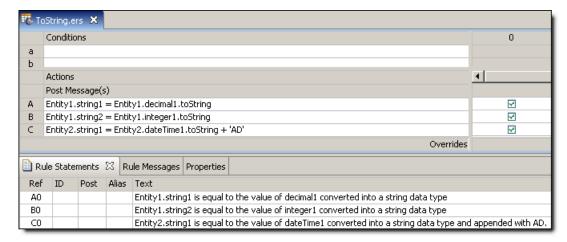

Converts a value to a data type of String.

USAGE RESTRICTIONS

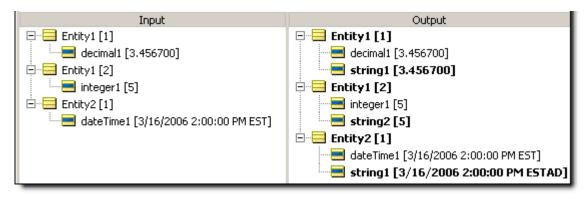

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses **.toString** to convert 3 data types to strings. Rule N.3 also uses the alternative String concatenation syntax. See Add Strings for details.

SAMPLE TEST

To time – casting a dateTime to a time

SYNTAX

<DateTime>.toTime

DESCRIPTION

Converts the value in <DateTime> to a Time data type, containing only the time portion of the full DateTime. If <DateTime> contains no time information, then the time portion is set to 12:00:00 AM in the current timezone.

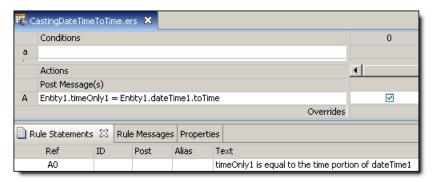

Note: Should this value be saved in a database field supporting a full DateTime, the date portion is saved as the epoch specified in com.corticon.crml.OclDate.epochForTimeValues. See Server Integration & Deployment Guide for a complete description of this and other properties inside CcCommon.properties.

USAGE RESTRICTIONS

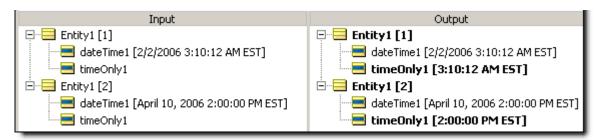

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .toTime to convert dateTime1 to Time and assign the value to TimeOnly1.

SAMPLE TEST

Trend

SYNTAX

<Collection.attribute> -> <Sequence>.trend

DESCRIPTION

Returns one of the following 4-character strings depending on the trend of <code><Collection.attribute></code> once sequenced by the same or different attribute in <code><Collection></code>. <code><Sequence></code> is an ordered set of <code><Collection></code> in the form $\{x_1, x_2, x_3 \dots x_n\}$, where

INCR	the value of <attribute> of element x_{n+1} is greater than or equal to the value of <attribute> of element x_n for every element. At least one <attribute> value of element x must be greater than that of x_{n-1}</attribute></attribute></attribute>
DECR	the value of <code><attribute></attribute></code> of element x_{n+1} is less than or equal to the value of <code><attribute></attribute></code> of element x_n for every element. At least one <code><attribute></attribute></code> value of element x must be less than that of x_{n-1}
CNST	the value of <attribute> of element x_{n+1} is equal to the value of <attribute> for element x_n for every element.</attribute></attribute>
NONE	any <sequence> with elements not meeting the requirements for INCR, DECR, or CNST</sequence>

An alternative way to understand this operator is to view the index attribute used to sequence the collection as the *independent* variable (traditionally plotted along the "x" axis in a standard x-y graph) in a set of data pairs. The attribute evaluated by the .trend operator, <Collection.attribute>, is the *dependent* variable, plotted along the "y" axis. When so plotted, the 4-character words returned by .trend correspond to curves with positive, negative,

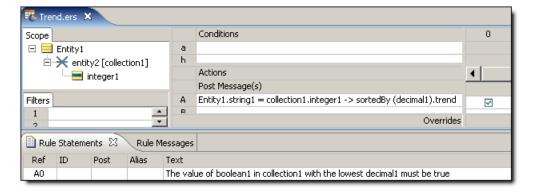

USAGE RESTRICTIONS

zero (constant), or arbitrary slopes.

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

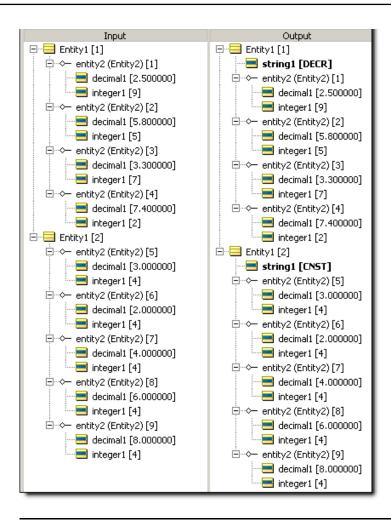

RULESHEET EXAMPLE

This Rulesheet uses the .trend function to analyze integer1 attributes within collection1 sorted by decimal1. The resulting trend value is assigned to string1.

SAMPLE TEST

Two sample tests provide two collections of elements, each with a decimal 1 and integer 1 values. Input and Output panels are shown below.

Note: Technically, the slope of an INCR curve need not be positive everywhere, but must have a first derivative (instantaneous slope) that is positive at some point along the curve and never be negative. The slope of a CNST curve must be zero everywhere.

True

SYNTAX

true or T

DESCRIPTION

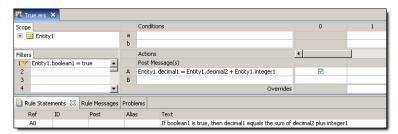

Represents Boolean value true. Recall from the discussion oftruth values that an <expression> is evaluated for its truth value, so the expression Entity1.boolean1=true will evaluate to true only if boolean1=true. But since boolean1 is Boolean and has a truth value all by itself without any additional syntax, we do not actually need the "=true" piece of the expression. Many examples in the documentation use explicit syntax like boolean1=true or boolean2=false for clarity and consistency, even though boolean1 or not boolean2 are equivalent logical expressions.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

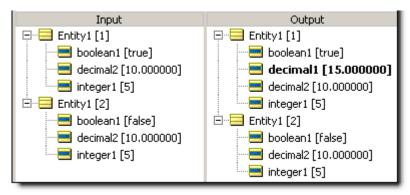

RULESHEET EXAMPLE

The following Rulesheet uses **true** in a Precondition to Ruletest whether boolean1 is true, and perform the Nonconditional computation if it is. As discussed above, the alternative expression <code>Entity1.boolean1</code> is logically equivalent.

SAMPLE TEST

A sample Ruletest provides three examples. Assume decimal2=10.0 and integer1=5 for all examples. Input and Output panels are shown below:

Uppercase

SYNTAX

<String>.toUpper

DESCRIPTION

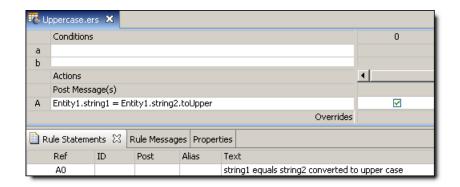

Converts all characters in <String> to uppercase.

USAGE RESTRICTIONS

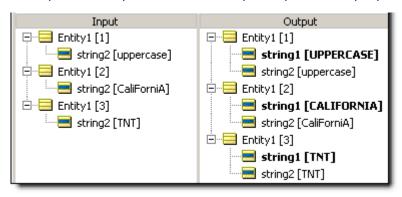

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .toUpper to convert string2 to uppercase and assign it to string1.

A sample Ruletest provides three examples. Input and Output panels are shown below:

Week of month

SYNTAX

<DateTime>.weekOfMonth

<Date>.weekOfMonth

DESCRIPTION

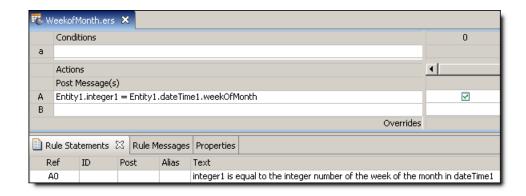

Returns an Integer from 1 to 6, equal to the week number within the month in <DateTime> or <Date>. A week begins on Sunday and ends on Saturday.

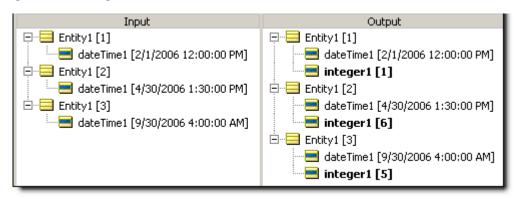

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .weekOfMonth to assign a value to integer1.

Week of year

SYNTAX

<DateTime>.weekOfYear

<Date>.weekOfYear

DESCRIPTION

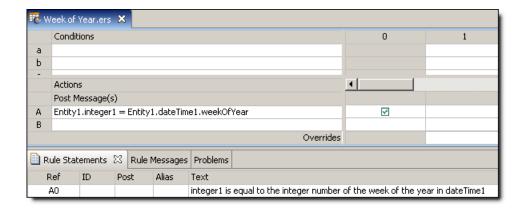

Returns an Integer from 1 to 52, equal to the week number within the year in <DateTime> or <Date>. A week begins on Sunday and ends on Saturday. When a year ends between Sunday and the next Friday, or in other words when a new year begins between Monday and the next Saturday, the final day(s) of December will be included in week 1 of the new year. For example, 12/29/2002 fell on a Sunday, so 12/29-31 are included in week 1 of 2003.

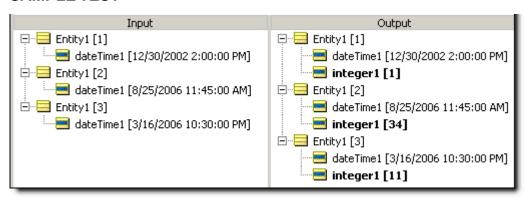

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .weekOfYear to assign a value to integer1.

Year

SYNTAX

<DateTime>.year

<Date>.year

DESCRIPTION

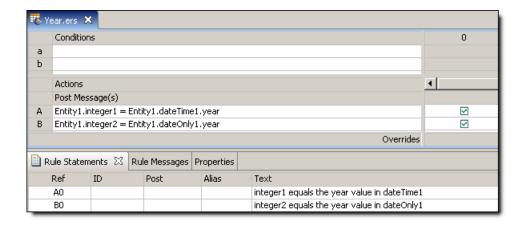

Returns the century/year portion of <DateTime> or <Date>. The returned value is a four digit Integer.

USAGE RESTRICTIONS

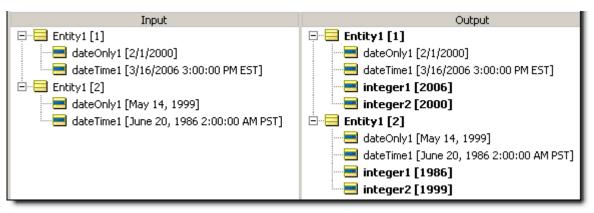

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

RULESHEET EXAMPLE

The following Rulesheet uses .year to evaluate dateTime1 and dateOnly1 and assign the year values to integer1 and integer2, respectively.

A sample Ruletest provides three examples of dateTime1 and dateOnly1. Input and Output panels are shown below:

Years between

SYNTAX

<DateTime1>.yearsBetween(<DateTime2>)

<Date1>.yearsBetween(<Date2>)

DESCRIPTION

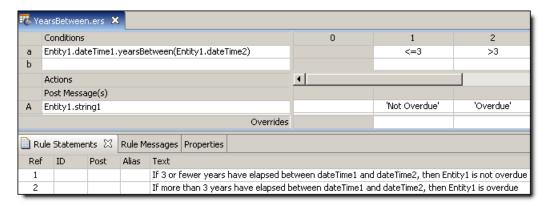

Returns the Integer number of years between DateTimes or between Dates. The number of months in <DateTime2> is subtracted from the number of months in <DateTime1>, and the result is divided by 12 and truncated. This function returns a positive number if <DateTime2> is later than <DateTime1>.

USAGE RESTRICTIONS

The Operators row of the table in Summary Table of Vocabulary Usage Restriction applies. No special exceptions.

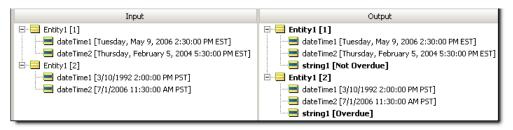

RULESHEET EXAMPLE

The following Rulesheet uses .yearsBetween to determine the number of months that have elapsed between dateTime1 and dateTime2, compare it to the Values set, and assign a value to string1.

SAMPLE TEST

A sample Ruletest provides dateTime1 and dateTime2 for two examples. Input and Output panels are shown below.

Special syntax

For details, see the following topics:

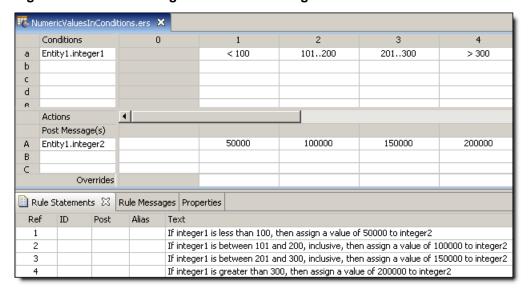

- Value ranges
- Using value sets in condition cells
- Using variables as condition cell values
- Embedding attributes in posted rule statements
- Including apostrophes in strings
- Advanced collection syntax
- Statement blocks

Value ranges

When using values in Condition Cells for Integers, Decimals, Strings, or DateTime data types, the values do not need to be precise – they can be in the form of a range (except for Boolean values.) A value range is typically expressed in the following format: x cdot y, where x and y are the starting and ending values for the range *inclusive* of the endpoints if there is no other notation to indicate otherwise. This is illustrated in Rulesheet using Numeric Value Ranges in Condition Values Set.

Numeric value ranges in conditions

Figure 6: Rulesheet using Numeric Value Ranges in Condition Values Set

In this example, we are assigning an integer2 value to Entity1 depending on its integer1 value. The value range 101..200 represents all values (integers in this case) between 101 and 200, including 101 and 200. This is an inclusive range because both the starting and ending values are included in the range.

Numeric value ranges in filter rows

Numeric value ranges can be used as Filter expressions as shown. Note the use of special term in, as shown below.

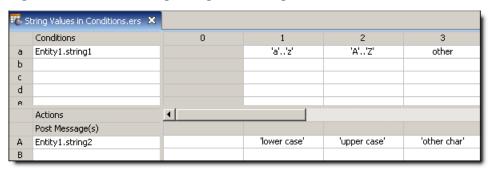

Figure 7: Rulesheet using a Numeric Value Range as a Precondition/Filter

String value ranges in condition cells

When using value range syntax with String types, be sure to enclose literal values inside single quotes, as shown in the following figure. Corticon Studio will usually perform this for you, but always check to make sure it has interpreted your entries correctly.

Figure 8: Rulesheet using String Value Ranges in Condition Values Set

String value ranges in filter rows

String value ranges can be used as Filter expressions as shown in the following figure:

Figure 9: Rulesheet using String Value Ranges in Precondition Value Set

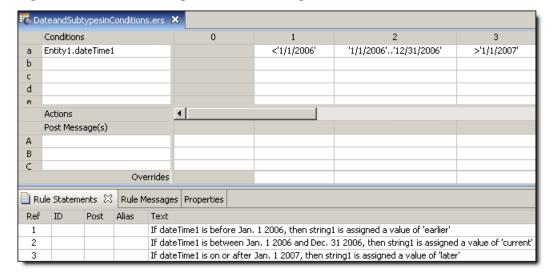

Note the use of special term in. Also notice the use of Boolean operator or to combine two expressions. This single Precondition is satisfied only if string1 is an English letter.

DateTime, date, and time value ranges in condition cells

When using value range syntax with date types, be sure to enclose literal date values inside single quotes, as shown:

Figure 10: Rulesheet using a Date Value Range in Condition Cells

DateTime, date, and time value ranges in filter rows

DateTime, Date, and Time value ranges can be used as Filter expressions as shown. Note the use of special term in.

Figure 11: Rulesheet using a Date Value Range in a Filter

176

Inclusive & exclusive ranges

Corticon Studio also gives you the option of defining value ranges where one or both of the starting and ending values are "exclusive", meaning that the starting/ending value is **not** included in the range of values. Rulesheet using an Integer Value Range in Condition Values Set shows the same Rulesheet as in Rulesheet using Numeric Value Ranges in Condition Values Set, but with one difference: we have changed the value range 201..300 to (200..300]. The starting parenthesis (indicates that the starting value for the range, 200, is excluded – it is **not** included in the range of possible values. The ending bracket] indicates that the ending value is inclusive. Since integer1 is an Integer value, and therefore no fractional values are allowed, 201..300 and (200..300] are equivalent and our Values set in Rulesheet using an Integer Value Range in Condition Values Set is still complete as it was in Rulesheet using Numeric Value Ranges in Condition Values Set.

Conditions 0 1 2 3 Entity1.integer1 < 100 101..200 (200..300]> 300 Ь С Actions 1 Post Message(s) 50000 100000 150000 200000 Entity1.integer2 Α Overrides 📄 Rule Statements 🛭 Rule Messages | Properties Ref If integer1 is less than 100, then assign a value of 50000 to integer2 2 If integer1 is between 101 and 200, inclusive, then assign a value of 100000 to integer2 3 If integer1 is between 201 and 300, inclusive, then assign a value of 150000 to integer2 If integer1 is greater than 300, then assign a value of 200000 to integer2 4

Figure 12: Rulesheet using an Integer Value Range in Condition Values Set

Listed below are all of the possible combinations of parenthesis and bracket notation for value ranges and their meanings:

```
(x..y) - is the range between x & y, excluding both x & y

(x..y] - is the range between x & y, excluding x and including y

[x..y) - is the range between x & y, including x and excluding y

[x..y] - is the range between x & y, including both x & y
```

As illustrated in Rulesheet using Numeric Value Ranges in Condition Values Set and Rulesheet using an Integer Value Range in Condition Values Set, if a value range has no enclosing parentheses or brackets, it is assumed to be closed. It is therefore not necessary to use the $[\,.\,.\,]$ notation for a closed range in Corticon Studio; in fact, if you try to create a closed value range by entering $[\,.\,.\,]$, the square brackets will be automatically removed. However, should either end of a value range have a parenthesis or a bracket, then the other end must also have a parenthesis or a bracket. For example, x..y) is not allowed, and is properly expressed as [x..y).

When using range notation, always ensure x is less than y, i.e., an ascending range. A range where x is greater than y (a descending range) may result in errors during rule execution.

Overlapping value ranges

One final note about value ranges: they **might overlap**. In other words, Condition Cells may contain the two ranges 0..10 and 5..15. It is important to understand that when overlapping ranges exists in rules, the rules containing the overlap are frequently ambiguous and more than one rule may fire for a given set of input Ruletest data.

Note: In Corticon 4.x and earlier, overlapping Value sets were not allowed.

Rulesheet with Value Range Overlap shows an example of value range overlap.

Figure 13: Rulesheet with Value Range Overlap

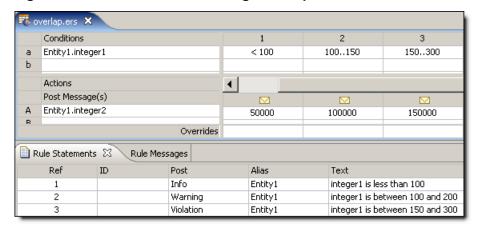

Figure 14: Rulesheet expanded with Ambiguity Check applied

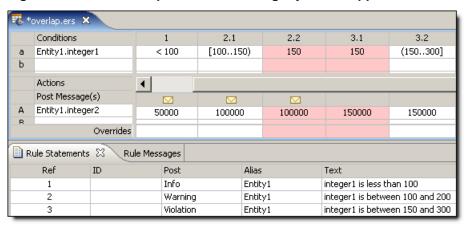

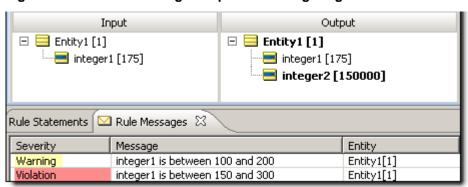

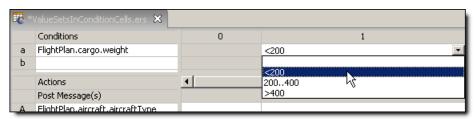

Figure 15: Ruletest showing multiple rules firing for given test data

Using value sets in condition cells

Most Conditions implemented in the Rules section of the Rulesheet use a single value in a Cell, as shown in the following figure:

Figure 16: Rulesheet with One Value Selected in Condition Cell

Sometimes, however, it is useful to combine more than one value in the same Cell. This is accomplished by holding CTRL while clicking to select multiple values from the Condition Cell drop-down box. When multiple values are selected in this manner, pressing ENTER will automatically enclose the resulting set in curly brackets { . . } in the Cell as shown in the sequence of Rulesheet with Two Values Selected in Condition Cell and Rulesheet with Value Set in Condition Cell. Additional values may also be typed into Cells. Be sure the comma separators and curly brackets remain correct during hand-editing.

Figure 17: Rulesheet with Two Values Selected in Condition Cell

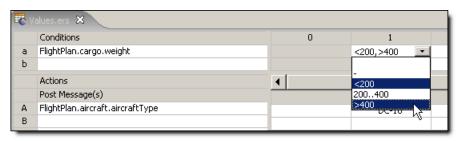

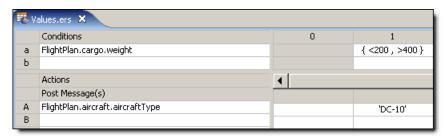

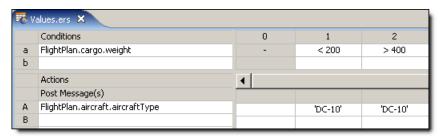

Figure 18: Rulesheet with Value Set in Condition Cell

The rule implemented in Column 1 of Rulesheet with Value Set in Condition Cell is logically equivalent to the Rulesheet shown in Rulesheet with Two Rules in Lieu of Value Set. Both are implementations of the following rule statement:

1. If a flightplan's cargo weight is less than 200 **OR** greater than 400, then the flightplan's aircraft type must be a DC-10

Figure 19: Rulesheet with Two Rules in Lieu of Value Set

If you write rules that are logically **OR**'ed in separate Columns, performing a Compression will reduce the Rulesheet to the fewest number of Columns possible by creating value sets in Cells wherever possible. Fewer Columns results in faster Rulesheet execution, even when those Columns contain value sets. Compressing the Rulesheet in Rulesheet with Two Rules in Lieu of Value Set will result in the Rulesheet in Rulesheet with Value Set in Condition Cell.

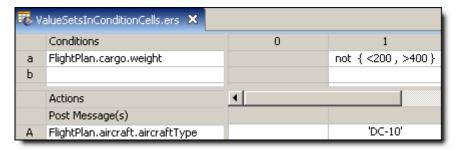

Condition Cell value sets can also be negated using the **not** operator. To negate a value, simply type not in front of the leading curly bracket { as shown in Negating a Value Set in a Condition Cell. This is an implementation of the following rule statement:

1. If a flightplan's cargo weight is **NOT** less than 200 **OR NOT** greater than 400, then the flightplan's aircraft type must be a DC-10

which, given the Condition Cell's value set, is equivalent to:

1. If a flightplan's cargo weight is between 200 and 400 (inclusive), then the flightplan's aircraft type must be a DC-10

Figure 20: Negating a Value Set in a Condition Cell

Value sets can also be created in the Overrides Cells at the foot of each Column. This allows one rule to override multiple rules in the same Rulesheet.

Using variables as condition cell values

You can use a variable as a condition's cell value. However, there are constraints:

• Either **all** of the rule cell values for a condition row contain references to the *same* variable (with the exception of dashes), or **none** of the rule cell values for a condition row reference *any* variable.

- Only one variable can be referenced by various rules for the same condition row.
- Logical expressions in the various rules for the same condition row should be logically non-overlapping.
- A condition value that uses a colon, such as A:B, is not valid.

Derived value sets are created by accounting for all logical ranges possible around the variable.

The following Rulesheet uses the Cargo Vocabulary to illustrate the valid and invalid use of variables. Note that the Vocabulary editor marks invalid values in red.

	Conditions	0	1	2	3
a	Aircraft.maxCargoVolume		< Cargo.volume	> Cargo.volume	Cargo.volume
b	Aircraft.maxCargoVolume		<= Cargo.volume	> Cargo.volume	-
С	Aircraft.maxCargoVolume		< Cargo.volume	> Cargo.volume	-
d	Aircraft.maxCargoVolume		< Cargo.volume	-	-
е					
f	Aircraft.maxCargoVolume		< Cargo.volume	FlightPlan.cargo.volume	Cargo.volume
g	Aircraft.maxCargoVolume		< Cargo.volume	5	1015
h	Aircraft.maxCargoVolume		< Cargo.volume	<= Cargo.volume	Cargo.volume
i	Aircraft.maxCargoVolume		A1:B2		

Derived values when using variables

The following tables abbreviate the attribute references shown in the illustration.

Table 1: Rulesheet columns

Conditions	1	2	3	Derived Value Set
A.maxCV	< C.v	> C.v	C.v	{< C.v, > C.v, C.v}
A.maxCV	<= C.v	> C.v		{<= C.v, > C.v }
A.maxCV	< C.v	> C.v		{< C.v, > C.v, C.v }
A.maxCV	< C.v			{< C.v, >= C.v}

Improper use of variables

Table 2: Rulesheet condition f: Attempt to use multiple variables

Conditions	1	2	3
A.maxCV	< C.v	> FP.c.v	C.v

Table 3: Rulesheet condition g: Attempt to mix variables and literals

Conditions	1	2	3
A.maxCV	< C.v	5	1015

Table 4: Rulesheet condition h: Attempt to use logically overlapping expressions

Conditions	1	2	3
A.maxCV	< C.v	<= C.v	C.v

Embedding attributes in posted rule statements

It is frequently useful to "embed" attribute values within a Rule Statement, so that posted messages contain actual data. Special syntax must be used to differentiate the static text of the rule statement from the dynamic value of the attribute. As shown in Sample Rulesheet with Rule Statements Containing Embedded Attributes, an embedded attribute must be enclosed by curly brackets { . . } to distinguish it from the static Rule Statement text.

It may also be helpful to indicate which parts of the posted message are dynamic, so a user seeing a message knows which part is based on "live" data and which part is the standard rule statement. As shown in Sample Rulesheet with Rule Statements Containing Embedded Attributes, square brackets are used immediately outside the curly brackets so that the dynamic values inserted into the message at rule execution will be "bracketed". The use of these square brackets is optional – other characters may be used to achieve the intended visual distinction.

Remember, Action Rows execute in numbered order (from top to bottom in the Actions pane), so a Rule Statement that contains an embedded attribute value must not be posted before the attribute has a value. Doing so will result in a null value inserted in the posted message.

Figure 21: Sample Rulesheet with Rule Statements Containing Embedded Attributes

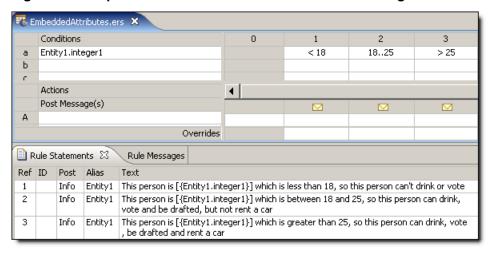

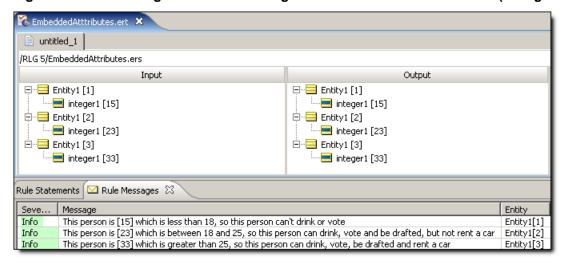

Figure 22: Rule Messages Window Showing Bracketed Embedded Attributes (Orange Box)

When an attribute uses an Enumerated Custom Data Type, the dynamic value embedded in the posted Rule Message will be the Value, not the Label. See the *Rule Modeling Guide*, "Building the Vocabulary" chapter for more information about Custom Data Types.

No expressions in Rule Statements

A reminder about the table in Summary Table of Vocabulary Usage Restriction, which specifies that the only parts of the Vocabulary that may be embedded in Rule Statements are attributes and functions (today and now). No operators or expressions are permitted inside Rule Statements. Often, operators will cause error messages when you try to save a Rule Set. Sometimes the Rule Statement itself will turn red. Sometimes an embedded equation will even execute as you intended. But sometimes no obvious error will occur, but the rule does not executed as intended. Just remember that operators and expressions are not supported in Rule Statements.

Including apostrophes in strings

String values in Corticon Studio are always enclosed in single quotes. But occasionally, you may want the String value to include single quote or apostrophe characters. If you enter the following text in Corticon Studio:

```
entity1.string1='Jane's dog Spot'
```

The text will turn red, because Corticon Studio thinks that the string1 value is 'Jane' and the remaining text s dog Spot' is invalid. To properly express a String value that includes single quotes or apostrophes, you must use the special character backslash (\) that tells Corticon Studio to ignore the apostrophe(s) as follows:

```
entity1.string1='Jane\'s dog Spot'
```

When preceded by the backslash, the second apostrophe will be ignored and assumed to be just another character within the String. This notation works in all sections of the Rulesheet, including Values sets. It also works in the Possible Values section of the Vocabulary Editor.

Advanced collection syntax

Collection syntax contains some subtleties which are worth learning once you are comfortable with the basics described in the *Rule Modeling Guide's* Collections chapter. It's sometimes helpful when writing collection expressions to step through them, left to right, as if you were reading a sentence. This helps us understand better how the pieces combine to create the full expression. It also helps us to know what else we can safely add to the expression to increase its utility. Let's try this approach in order to dissect the following expression:

```
Collection1 -> sortedBy(attribute1) -> last.attribute2
```

1. Collection1

This expression returns the collection $\{e_1, e_2, e_3, e_4, e_5, \dots e_n\}$ where e_x is an element (an entity) in Collection1. We already know that alias Collection1 represents the entire collection.

2. Collection1 -> sortedBy(attribute1)

This expression returns the collection $\{e_1, e_2, e_3, e_4, e_5, \dots e_n\}$ arranged in ascending order based on the values of attribute1 (which we call the "index").

3. Collection1 -> sortedBy(attribute1) -> last

returns $\{e_n\}$ where e_n is the last element in Collection1 when sorted by <code>attribute1</code>

This expression returns a **specific entity** (element) from Collection1. It does not return a specific value, but once we have identified a specific entity, we can easily reference the value of any attribute it contains, as in the following:

4. Collection1 -> sortedBy(attribute1) -> last.attribute2

which returns {e_n.attribute2}

This expression not only returns a specific value, but just as importantly, it also returns the entity the value belongs to. This "entity context" is important because it allows us to do things to the entity itself, like assign a value to one of its attributes. For example:

```
Collection1 -> sortedBy(attribute1) -> last.attribute2='xyz'
```

The above expression will assign the value of xyz to attribute2 of the entity whose attribute1 is highest in Collection1. Contrast this with the following:

```
Collection1.attribute1 -> sortedBy(attribute1) -> last
```

which returns a single integer value, like 14.

Notice that all we have now is a number, a *value*. We have lost the entity context, so we can't do anything to the entity that owns the attribute with value of 14. In many cases, this is just fine. Take for example:

```
Collection1.attribute1 -> sortedBy(attribute1) -> last > 10
```

In this expression, it is not important that we know which element has the highest value of attribute1, all we want to know is if the highest value (whomever it "belongs" to) is greater than 10.

Understanding the subtleties of collection syntax and the concept of entity context is important because it helps us to use the returned entities or values correctly. For example:

Return the lower of the following two values:

- 12
- The age of the oldest child in the family

What is really being compared here? Do we care *which* child is oldest? Do we need to know his or her name? No. We simply need to compare the age of that child (whichever one is oldest) with the value of 12. So this is the expression that models this logic:

```
family.age -> sortedByDesc(age) -> first.min(12)
```

.min, as we know, is an operator that *acts upon* numeric data types (Integer or Decimal). And since we also know that family.age -> sortedByDesc(age) -> first returns a number, then it is legal and valid to use .min at the end of this expression.

What about this scenario: Name the youngest child Junior.

```
family -> sortedByDesc(age) -> last.name='Junior'
```

Now we want to return a *specific entity* – that of the youngest child – and assign to its name a value of Junior. We need to keep the entity context in order to make this assignment, and the expression above accomplishes this.

Statement blocks

Sequence operators can easily extract an attribute value from the first, last or other specific element in a sorted collection (see first, last, or at(n) for examples). This is especially useful when the attribute's value is involved in a comparison in a Conditional or Preconditional rule. Sometimes, however, you want to identify a particular element in a sequence and "flag" or "tag" it for use in subsequent rules. This can be accomplished using special syntax called Statement Blocks.

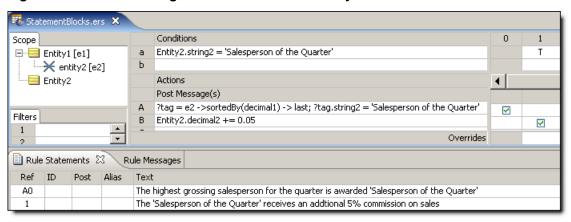

Statement Blocks, permitted only in the Action rows of the Rulesheet, use special variables, prefixed by a ? character, to "hold" or "pin" an element so that further action may be taken on it, including tagging it by assigning a value to one of its attributes. These special holder variables may be declared "on the fly", meaning they do not need to be defined anywhere prior to use.

Here's an example. In a sales management system, the performance of sales reps is analyzed every quarter, and the highest grossing sales rep is awarded "Salesperson of the Quarter". This special status is then used to automatically increase the rep's commission percentage on sales made in the following quarter. We will use the same generic Vocabulary as in all previous examples, but make these assumptions:

Vocabulary Term	Meaning
Entity2 a salesperson	
Entity1.entity2	collection of salespeople
Entity2.string1	a salesperson's name
Entity2.decimal1	a salesperson's quarterly sales
Entity2.string2	a salesperson's award
Entity2.decimal2	a salesperson's commission percentage

Using this Vocabulary, we construct the Rulesheet shown in

Figure 23: Rulesheet using Statement Block to Identify and Reward Winner

Important Notes about Statement Blocks

As expressed in Action row A in the figure above, a statement block consists of two separate expressions:

- 1. the first part assigns an element of a sequence to a special holder variable, prefixed by the ? character. This variable is unusual because it represents an element, not a value. Here, the highest grossing salesperson is expressed as the last element of the collection of salespeople (e2), sorted in ascending order according to quarterly sales (decimal1). Once identified by the sequencing operator Dlast, this salesperson is momentarily "held" by the ?tag variable, which we declared "on-the-fly".
- 2. the second part of the statement the part following the semicolon assigns a value to an attribute of the element held by the ?tag. In our example, we are assigning a value of 'Salesperson of the Quarter' to the string2 attribute of the salesperson held by ?tag. In effect, we have "tagged" the highest grossing salesperson with this award.
- 3. the two parts above must be included on the same Action Row, separated by a semicolon. If the two parts are separated in different sections or in different Rows of the same section, the element represented by the ? variable is "lost", in other words, ?tag loses its "grip" on the element identified by the sequencing operator.

Now that we have tagged our winner, we can use the tagged element (awardee) to take additional actions. In the Conditional rule, we increase the commission percentage of the winner by 5% using the increment operator.

The next figure shows a Ruletest Input and Output pane. As expected, our highest grossing salesperson has been awarded "Salesperson of the Year" honors, and has had her commission raised by an additional 5%.

A

Character precedence: Unicode & Java Collator

The Unicode standard assigns a 4 digit (hexadecimal) code to every character, including many that can't be typed on standard keyboards. Java (and hence Progress Corticon software) uses a special method named Collator to sort these characters in specific sequences based on the I18n locale of the user.

While sorting by locale allows for regional variations of language-specific characters like accents, the combination of these two systems can also make determining character precedence very complicated. The Unicode code and Java Collator sequence for standard keyboards in US-English locale is shown in the table below.

Sequences for other languages and/or locales may differ, and many other Unicode characters are available but are not shown in the table. We recommend http://www.unicode.org/charts for more information on the Unicode system and http://java.sun.com/docs/books/tutorial/i18n/text/locale.html for more information on the Java Collator method.

- 'Z' = 'z' evaluates to true because character Z has the same precedence as z (69=69). A given letter has the same precedence regardless of its case. This is an important difference between character precedence determined by ISO or ASCII systems, and the Java Collator system used by Corticon.
- 'C & S' < 'C and S' evaluates to true because character a has a higher precedence than & (26 < 44). These characters are decisive because they are the first different characters encountered as the two strings are compared beginning with characters in position 1.
- 'B' > 'aardvark' evaluates to true because character B has a higher precedence than a (45 > 44).
- 'Marilynn' < 'Marilyn' evaluates to false because character n has a higher precedence than <space> (57 > 1). The first seven characters of each String are identical, so the final character comparison is decisive.

character	name	precedence	Unicode 5.0 code
	typed space	1	0020

	-	Subtraction	10.0 – 5.5
5	<	Less Than	5.5 < 10
	<=	Less Than Or Equal To	5.5 <= 5.5
	>	Greater Than	10 > 5.5
	>=	Greater Than Or Equal To	10 >= 10
6	=	Equal	5.5=5.5
	<>	Not Equal	5.5 <> 10
7	**	Exponentiation	10 ** 2

DateTime data type

FORMATS OR MASKS

DateTime information may take many different formats. Corticon Studios use a common source of acceptable DateTime, Date Only, and Time Only formats, also known as "masks".

For example, a date mask may specify yyyy-MM-dd as an acceptable date format, which means that an attribute of type DateTime (or Date) may "hold" or "contain" data that conforms to this format. '2013-04-12' conforms to this mask; 'April12th, 2013' does not.

For proper execution, it is important to ensure that date formats used during rule development and testing (and are included in the rule builders' Corticon Studio installations) are also present in the Corticon Server's installation. See Server Integration & Deployment Guide for more details about setting and modifying masks in both Corticon Studio and Corticon Server.

PRESENTATION AND PERSISTENCE

Most commercial databases represent dates as DateTimes. Such DateTimes are frequently stored as UTC, namely the number of milliseconds that have transpired from an arbitrary epoch (for example, 1/1/1970 00:00:00 GMT); this is not a universal standard but is a very popular convention. UTC dates can be *rendered* in the user's local time zone, *but this is merely a matter of presentation*. A UTC represents a simultaneous point in time for two observers regardless of where on earth they reside.

However, some date or time concepts, such as *holiday*, cannot be expressed conveniently as a discrete time point. *Christmas* (12/25/XX) actually denotes different time frames depending on the observers' time zones; thus, Corticon *carries* (that is, holds in memory) all dates in GMT with the time portion zeroed (that is, midnight). This approach addresses the holiday problem because a user can enter holiday dates into the database and not have them shift when they are rendered in the user's local time zone.

Carrying GMT dates should be transparent to the user. Dates expressed as strings in incoming XML are parsed and the proper data type is inferred; for dates, they are immediately instantiated as GMT and rendered back in GMT with no conversion.
