# 1 Common Event Format (CEF) Logs

This document outlines the details of the Kemp Common Event Format (CEF) logs for the Edge Security Pack (ESP) feature. CEF logs were introduced in LoadMaster firmware version 7.2.50.

Allow connection scaling over 64K Connections	<input type="checkbox"/>
Always Check Persist	<input type="text" value="No"/>
Add Port to Active Cookie	<input type="checkbox"/>
Conform to RFC	<input checked="" type="checkbox"/>
Close on Error	<input type="checkbox"/>
Add Via Header In Cache Responses	<input type="checkbox"/>
Real Servers are Local	<input type="checkbox"/>
Drop Connections on RS failure	<input type="checkbox"/>
Drop at Drain Time End	<input type="checkbox"/>
L7 Connection Drain Time (secs)	<input type="text" value="300"/> <a href="#">Set Time</a> (Valid values:0, 60 - 86400)
L7 Authentication Timeout (secs)	<input type="text" value="30"/> <a href="#">Set Timeout</a> (Valid values:30 - 300)
L7 Wait after POST(ms)	<input type="text" value="2000"/> <a href="#">Set Post Wait</a> (Valid values:1 - 2000)
L7 Client Token Timeout (secs)	<input type="text" value="120"/> <a href="#">Set Timeout</a> (Valid values:60 - 300)
Additional L7 Header	<input type="text" value="X-Forwarded-For"/>
100-Continue Handling	<input type="text" value="RFC-7231 Compliant"/>
Allow Empty POSTs	<input type="checkbox"/>
Allow Empty HTTP Headers	<input type="checkbox"/>
Force Complete RS Match	<input type="checkbox"/>
Least Connection Slow Start	<input type="text" value="0"/> <a href="#">Set Slow Start</a> (Valid values:0 - 600)
Share SubVS Persistence	<input type="checkbox"/>
Log Insight Message Split Interval	<input type="text" value="10"/> <a href="#">Set Log Split Interval</a> (Valid values:1 - 100)
Include User Agent Header in User Logs	<input type="checkbox"/>
Use CEF Log Format	<input checked="" type="checkbox"/>
SSO Maximum Threads	<input type="text" value="128"/> <a href="#">Set SSO Max Threads</a> (Valid values:64 - 512)
NTLM Proxy Mode	<input checked="" type="checkbox"/>

To enable the CEF log format, go to **System Configuration > Miscellaneous Options > L7 Configuration** and select the **Use CEF Log Format** check box.

CEF is an open log management standard that improves the interoperability of security-related information from different security and network devices and applications. CEF was developed by ArcSight and uses UTF-8 Unicode.

The CEF logs are composed of a header and an extension. The header is well-defined within the specification and the extension is a key-value pair vendor-specific segment. The format of the logs is as follows:

1 Common Event Format (CEF) Logs

CEF:Version|Device Vendor|Device Product|Device Version|Device Event Class  
ID|Name|Severity|[Extension]

# 2 CEF Header

The CEF header comprises of everything bar the [Extension]. ArcSight describes the CEF Header as follows:

## Version

This is an integer and identifies the version of the CEF format. Event consumers use this information to determine what the following fields represent. The current CEF version is 0 (CEF:0).

The Kemp Version is '0'.

## Device Vendor, Device Product, and Device Version

These are strings that uniquely identify the type of sending device. No two products may use the same device-vendor and device-product pair. There is no central authority managing these pairs. Event producers must ensure that they assign unique name pairs.

The Kemp Device Vendor is 'Kemp', the Device Product is 'LM' and the Device Version is '0'.

---

LM is an abbreviation for LoadMaster.

---

## Device Event Class ID

This is a unique identifier per event-type. This can be a string or an integer. The Device Event Class ID identifies the type of event reported. In the Intrusion Detection System (IDS) world, each signature or rule that detects certain activity has a unique Device Event Class ID assigned. This is a requirement for other types of devices too, and helps correlation engines to process the events. This is also known as the Signature ID.

## Name

This is a string representing a human-readable and understandable description of the event. The event name should not contain information that is specifically mentioned in other fields.

## Severity

This is a string or integer and reflects the importance of the event.

The valid string values are Unknown, Low, Medium, High, and Very-High.

The valid integer values are 0-3=Low, 4-6=Medium, 7-8=High, and 9-10=Very-High.

## 2 CEF Header

The Kemp Device Event Class ID, Name, and Severity are outlined in the table below. These all correlate together to provide a full understanding of the type and severity of the CEF log.

Device Event Class ID	Name	Severity
0	Accept	0 (Low)
1	Slave accept	0 (Low)
2	SSL accept	0 (Low)
3	Connection timed out	1 (Low)
4	Connected	1 (Low)
5	Connection failed	3 (Low)
6	Logged off	1 (Low)
7	User interaction	2 (Low)
8	Logged on	1 (Low)
9	Access Denied	6 (Medium)
10	Access Blocked	6 (Medium)
11	Access Locked	
12	Access Disabled	6 (Medium)
13	Password Expired	6 (Medium)
14	Request	1 (Low)
15	Attempt	2 (Low)
16	Attempted XSS attack	9 (Very High)
17	SMTP parse failure	7 (High)
18	SMTP Blocked	6 (Medium)

2 CEF Header

Device Event Class ID	Name	Severity
19	Blocked access to directory	6 (Medium)
20	Blocked access to host	6 (Medium)

# 3 CEF Extension

The Kemp Technologies CEF Extension is a key-value pairing of information providing extra details based on the 'Device Event Class ID'. This is clarified through the use of examples below.

The following example shows an 'Accept' message with 'Device Event Class ID' of '0'.

**CEF:0|Kemp|LM|1.0|0|Accept|0|vs=10.35.46.238:80 event=Accept srcip=10.35.2.98 srcport=61518 msg=Accept**

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request
msg	This is a free-form string providing extra details

The following example shows a 'Slave Accept' message with 'Device Event Class ID' of '1':

**CEF:0|Kemp|LM|1.0|1|Slave accept|0|vs=10.35.46.238:80 event=Slave accept srcip=10.35.2.98 srcport=57432 msg=Slave accept**

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request
msg	This is a free-form string providing extra details

The following example shows an 'SSL Accept' message with 'Device Event Class ID' of '2':

## 3 CEF Extension

```
CEF:0|Kemp|LM|1.0|2|SSL accept|0|vs=10.35.46.238:443 event=SSL accept
srcip=10.35.2.98 srcport=51639 msg=SSL accept
```

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request

The following example shows a 'Connection Timed Out' message with 'Device Event Class ID' of '3':

```
CEF:0|Kemp|LM|1.0|3|Connection timed out|1|vs=10.35.46.235:443
event=Connection timed out srcip=10.35.2.98 srcport=51723 msg=waiting for
initial client request await_remaddr=0
```

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request
msg	This is a free-form string providing extra details
await_remaddr	Internal flag - likely to be zero

The following example shows an 'Connected' message with 'Device Event Class ID' of '4':

```
CEF:0|Kemp|LM|1.0|4|Connected|1|vs=10.35.46.235:443 event=Connected
srcip=10.35.2.98 srcport=51675 dstip=172.20.0.129 dstport=80
```

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination

## 3 CEF Extension

Extension key-value pair	Description
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request
dstip	This is the destination IP address for this connection
dstport	This is the destination port for this connection

The following example shows a 'Connection Failed' message with 'Device Event Class ID' of '5':

**CEF:0|Kemp|LM|1.0|5|Connection failed|3|vs=10.35.46.238:80 event=Connection failed srcip=10.35.2.98 srcport=57378 dstip=172.20.0.129 dstport=82**

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request
dstip	This is the destination IP address for this connection
dstport	This is the destination port for this connection

The following example shows a 'Logged off' message with 'Device Event Class ID' of '6':

**CEF:0|Kemp|LM|1.0|6|Logged off|1|vs=10.35.46.238:443 event=Logged off user=mohit@kpauto.net srcip=10.35.2.98**

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header

## 3 CEF Extension

Extension key-value pair	Description
user	The user that was entered in the ESP form and logged on
srcip	This is the source IP address that originated the request

The following example shows an 'Accept' message with 'Device Event Class ID' of '7':

**CEF:0|Kemp|LM|1.0|7|User interaction|2|vs=10.35.46.238:443 event=User interaction srcip=10.35.2.98 user=mohit@kpauto.net msg=requires password reset**

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request
msg	This is a free form string providing extra details

The following example shows a 'Logged On' message with 'Device Event Class ID' of '8':

**CEF:0|Kemp|LM|1.0|8|Logged on|1|vs=10.35.46.157:443 event=Logged on srcip=10.35.2.45 user=mgupta@kempqaesp.net msg=logged on**

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
user	The username of the user who attempted to log on
msg	This is a free-form string providing extra details

The following example shows an 'Access Denied' message with 'Device Event Class ID' of '9':

**CEF:0|Kemp|LM|1.0|9|Access Denied|6|vs=10.35.46.252:443 event=Access Denied srcip=10.35.8.8 user=mohit@kempqaesp.net msg=denied access**

The CEF Extension comprises of:

## 3 CEF Extension

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
user	The username of the user who attempted to log on
msg	This is a free-form string providing extra details

The following example shows an 'Access Blocked' message with 'Device Event Class ID' of '10':

**CEF:0|Kemp|LM|1.0|10|Access Blocked|6|vs=10.35.46.242:443 event=Access Blocked srcip=10.35.2.98 user=mohit msg=blocked access**

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
user	The user that was entered into the ESP form and logged on
msg	This is a free-form string providing extra details

The following example shows an 'Access Locked' message with 'Device Event Class ID' of '11':

**TBD**

The following example shows an 'Access Disabled' message with 'Device Event Class ID' of '12':

**CEF:0|Kemp|LM|1.0|12|Access Disabled|6|vs=10.35.46.252:443 event=Access Disabled srcip=10.35.2.45 user=mohit@kempqaesp.net msg=account disabled**

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as

## 3 CEF Extension

Extension key-value pair	Description
	the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
user	The user that was entered into the ESP form and logged on
msg	This is a free-form string providing extra details

The following example shows an 'Password Expired' message with 'Device Event Class ID' of '13':

**CEF:0|Kemp|LM|1.0|13|Password Expired|6|vs=10.35.46.252:443 event=Password Expired srcip=10.35.8.8 user=mohit@kempqaesp.net msg=password expired**

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
user	The user that was entered into the ESP form and logged on
msg	This is a free-form string providing extra details

The following example shows a 'Request' message with 'Device Event Class ID' of '14':

**CEF:0|Kemp|LM|1.0|14|Request|1|vs=10.35.46.157:443 event=Request srcip=10.35.2.45 srcport=54548 method=GET url=https://10.35.46.157/user=mgupta@kempqaesp.net useragent=Mozilla/5.0**

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request

## 3 CEF Extension

Extension key-value pair	Description
method	The HTML method, for example GET or POST.
URL	The URL that the user is trying to access.
user	The user making the request.

The following example shows an 'Attempt' message with 'Device Event Class ID' of '15':

```
CEF:0|Kemp|LM|1.0|15|Attempt|2|vs=10.35.46.252:443 event=Attempt
srcip=10.35.2.98 srcport=56593 method=GET url=https://10.35.46.252/owa/
useragent=Mozilla/5.0 (Macintosh; Intel Mac OS X 10.15; rv:91.0)
Gecko/20100101 Firefox/91.0
```

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request
method	The HTML method, for example GET or POST.
URL	The URL that the user is trying to access.
user	The user making the request.

The following example shows an 'Attempted XSS attack' message with 'Device Event Class ID' of '16':

```
CEF:0|Kemp|LM|1.0|16|Attempted XSS attack|9|vs=10.35.46.238:443
event=Attempted XSS attack srcip=10.35.2.98 srcport=61038 dtcode=6
```

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header

## 3 CEF Extension

Extension key-value pair	Description
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request
dtcode	This only appears if someone is trying to access an ESP Virtual Service in a way that suggests they are trying to hack the system (for example, there are missing fields or bad characters in the request)

The following example shows an 'SMTP Parse Failure' message with 'Device Event Class ID' of '17':

```
2020-06-24T15:51:08+00:00 1b100 17log: CEF:0|Kemp|LM|1.0|14|SMTP parse failure|7|vs=10.1.133.11:25 event=SMTP parse failure src=10.0.71.175:61401
```

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
src	This is the Source IP address: Port that originated the request

The following example shows an 'SMTP Blocked' message with 'Device Event Class ID' of '18':

```
2020-06-24T15:49:20+00:00 1b100 17log: CEF:0|Kemp|LM|1.0|15|SMTP Blocked|6|vs=10.1.133.11:25 event=SMTP Blocked src=10.0.71.175:61401 resource=ktest.com
```

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
src	This is the Source IP address: Port that originated the request
resource	The URL that someone is trying to access.

## 3 CEF Extension

The following example shows a 'Blocked access to directory' message with 'Device Event Class ID' of '19':

```
CEF:0|Kemp|LM|1.0|19|Blocked access to directory|6|vs=10.35.46.238:443
event=Blocked access to directory srcip=10.35.2.98 srcport=61108 resource=/
```

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request
resource	The URL that someone is trying to access.

The following example shows a 'Blocked access to host' message with 'Device Event Class ID' of '20':

```
CEF:0|Kemp|LM|1.0|20|Blocked access to host|6|vs=10.35.46.238:443
event=Blocked access to host srcip=10.35.2.98 srcport=61096
resource=10.35.46.238
```

The CEF Extension comprises of:

Extension key-value pair	Description
vs	This is the Virtual Service IP address: Port combination
event	This is a string describing the event type; typically, the same as the 'Name' field in the CEF header
srcip	This is the source IP address that originated the request
srcport	This is the source port that originated the request
resource	The URL or IP address that someone is trying to access.
