Introduction

Introduction

The LoadMaster combines versatility with ease-of-use to speed deployment of the complete portfolio of advanced messaging applications and protocols used by Microsoft Exchange 2019 (Exchange 2019), including Outlook on the Web, MAPI/HTTP, Outlook Anywhere (OA), Exchange ActiveSync (EAS), Simple Mail Transfer Protocol (SMTP), Post Office Protocol version 3 (POP3), Internet Message Access Protocol version 4 (IMAP4) and Office Online Server (OOS). With built-in SSL acceleration and/or overlay, the LoadMaster offloads a key source of CPU drain to improve the capacity of the Exchange 2019 infrastructure. Layer 7 health checking at the LoadMaster ensures that if one of the client access components becomes inaccessible, the load balancer will take that component offline for that server, while automatically re-routing and reconnecting users to other functioning servers.

The entire LoadMaster product family, including the Virtual LoadMaster (VLM) supports Exchange 2019, and includes a comprehensive first year warranty and technical support agreement.

About This Manual

About This Manual

This manual addresses how to deploy and configure a LoadMaster appliance with Exchange 2019 using Progress Kemp application templates.

Progress Kemp's LoadMaster family of products is available in various models to support networks of different throughput requirements. Information in this manual applies to all LoadMaster models.

Prerequisites

Prerequisites

This guide assumes the reader is a network administrator or familiar with networking and general computer terminology. It is further assumed that the Exchange 2019 environment is set up and the LoadMaster is installed.

LoadMaster documentation is available at <https://docs.progress.com>.

At a minimum, you should have:

- Installed the Microsoft Servers, Active Directories, and followed other Microsoft requirements.
- Installed the LoadMaster on the same network as the servers.
- Established access to the LoadMaster Web User Interface (WUI).

Exchange 2019 Overview

Exchange 2019 Overview

Microsoft Exchange Server is a mail server, calendaring software, and contact manager. It runs on Windows Server and is part of the Microsoft Servers line of products. The improvements made in Exchange 2019 have made it easier to load balance Exchange-related traffic.

Exchange 2019 includes the following solutions for switchover and failover redundancy:

- **High availability:** Exchange 2019 uses Database Availability Groups (DAGs) to keep multiple copies of your mailboxes on different servers synchronized. That way, if a mailbox database fails on one server, users can connect to a synchronized copy of the database on another server.
- **Site resilience:** You can deploy two active directory sites in separate geographic locations, keep the mailbox data synchronized between the two, and have one of the sites take on the entire load if the other fails.
- **Online mailbox moves:** During an online mailbox move, email accounts are still accessible. Users are only locked out for a brief period of time at the end of the process when the final synchronization occurs. Online mailbox moves can be performed across forests or in the same forest.
- **Shadow redundancy:** Shadow redundancy protects the availability and recoverability of messages while they are in transit. With shadow redundancy, the deletion of a message from the transport databases is delayed until the transport server verifies that all the next hops for that message are completed. If any of the next hops fail before reporting successful delivery, the message is resubmitted for delivery to the hop that did not complete.

Understanding Server Load Balancing

Understanding Server Load Balancing

Server load balancing is a way to manage which servers receive traffic. Server load balancing provides failover redundancy to ensure users continue to receive service in case of failure. It also enables your deployment to handle more traffic than one server can process while offering a single host name for clients.

Server load balancing serves two primary purposes. It reduces the impact of server failures within an exchange organization. In addition, server load balancing ensures that the load on the CAS and transport services are optimally distributed.

As OWA is rendered on the same server that is hosting the user's mailbox database; if a client hits a different CAS, there is no performance degradation because the session rendering for that user is already up and running.

Forms-based authentication is improved. The authentication cookie is provided to the user after logon and it is encrypted using the CAS's SSL certificate. This allows a logged in user to resume their session on a different CAS without having to re-authenticate (if servers share the same SSL certificate).

Enable Subnet Originating Requests Globally

Enable Subnet Originating Requests Globally

It is best practice to enable the **Subnet Originating Requests** option globally.

In a one-armed setup (where the Virtual Service and Real Servers are on the same network/subnet) **Subnet Originating Requests** is usually not needed. However, enabling **Subnet Originating Requests** should not affect the routing in a one-armed setup.

In a two-armed setup where the Virtual Service is on network/subnet A, for example, and the Real Servers are on network B, **Subnet Originating Requests** should be enabled on LoadMasters with firmware version 7.1-16 and above.

When **Subnet Originating Requests** is enabled, the Real Server sees traffic originating from 10.20.20.21 (LoadMaster eth1 address) and responds correctly in most scenarios.

With **Subnet Originating Requests** disabled, the Real Server sees traffic originating from 10.0.0.15 (LoadMaster Virtual Service address on **eth0**) and responds to **eth0** which could cause asymmetric routing.

When **Subnet Originating Requests** is enabled globally, it is automatically enabled on all Virtual Services. If the **Subnet Originating Requests** option is disabled globally, you can choose whether to enable **Subnet Originating Requests** on a per-Virtual Service basis.

To enable **Subnet Originating Requests** globally, follow the steps below:

1. In the main menu of the LoadMaster User Interface (UI), go to **System Configuration > Miscellaneous Options > Network Options**.
2. Select the **Subnet Originating Requests** check box.

100-Continue Handling

100-Continue Handling

To avoid issues with Exchange Web Services, especially in hybrid configuration, configure 100-continue handling to comply with RFC-7231 instead of the standard setting of RFC-2616.

To resolve this issue, apply the following setting on the LoadMaster.

100-Continue handling = RFC-7231 Complaint

1. To select **RFC-7231 Compliant** globally, follow the steps below:
 1. In the main menu of the LoadMaster WUI, go to **System Configuration > Miscellaneous Options > L7 Configuration**.

100-Continue Handling 

1. Select **RFC-7231 Complaint** under **100-Continue Handling**.

Additional L7 Header

Additional L7 Header

When using the built-in Mail client on Mac, you may experience connectivity issues. This happens due to how the Mail client on Mac handles Persistent-Auth headers from the Exchange server. This behavior is not present on Outlook for Mac clients or any Windows Office clients.

To resolve this issue, apply the following settings on the LoadMaster.

Additional L7 Header = None

To select **None** for **Additional L7 Header** globally, follow the steps below:

1. In the main menu of the LoadMaster WUI, go to **System Configuration > Miscellaneous Options > L7 Configuration**.

Additional L7 Header 

2. Select **None** under **Additional L7 Header**.

Virtual Service Templates

Virtual Service Templates

Progress Kemp have developed templates containing our recommended settings for Exchange 2019. These templates can be installed on the LoadMaster and can be used when creating each of the Virtual Services. Using a template automatically populates the settings in the Virtual Services. This is quicker and easier than manually configuring each Virtual Service. If needed, you can make changes to any of the Virtual Service settings after using the templates.

Download released templates from the following page: [LoadMaster Templates](#).

For more information and steps on how to import and use templates, refer to the **Virtual Services and Templates, Feature Description**.

This guide outlines the steps for setting up Virtual Services using Progress Kemp Application Templates. The Exchange 2019 templates currently available are grouped in three downloadable files as follows:

- **Exchange2019Core**
 - This file contains templates for non-SSL offloaded HTTPS, SSL offloaded HTTPS, and SMTP Virtual Services.
 - This is the primary set of services required to balance Exchange 2019.
- **Exchange2019ESP**
 - This set contains individual templates for a HTTPS service with SSL offloading and an SMTP service, both with ESP enabled.
 - These services are only necessary if you want to use ESP functionality.
- **Exchange2019Additional**
 - This set contains templates for IMAP, POP, and SMTP services, including variants for STARTTLS and SSL secured services.

Configuring Virtual Services for Exchange 2019

Configuring Virtual Services for Exchange 2019

Follow the instructions below to set up an Exchange Virtual Services using application templates. To configure the Virtual Services using the Application Programming Interface (API), refer to the **RESTful API** on the [Documentation page](#).

The [Exchange 2019 Virtual Service Recommended API Settings \(Optional\)](#) section outlines the recommended settings and values. You can use the API parameters and values when using the LoadMaster API and automation tools.

Note: When using the Web Application Firewall (WAF) in a Microsoft Exchange environment, ensure to enable WAF at the SubVS level to avoid issues with ActiveSync because standard WAF is unable to interpret the protocols used by ActiveSync.

HTTPS Offloaded Virtual Service or Reencrypted without ESP Virtual Service

HTTPS Offloaded Virtual Service or Reencrypted without ESP Virtual Service

The steps are the same when using Exchange HTTPS Offload and Exchange HTTPS Reencrypted with ESP application templates. To add the Virtual Services for Exchange HTTPS Offload or Exchange HTTPS Reencrypted, using the template, follow the steps below:

1. Click **Virtual Services**.
2. Click **Add New**.
3. Enter a **Virtual Address**.
4. Select the **Exchange 2019 HTTPS Offloaded** or the **Exchange 2019 HTTPS ReEncrypted** template from the **Use Template** drop-down list depending on your preference.
5. Click **Add This Virtual Service**.

Configure ESP

Configure ESP

This guide assumes an SSO Domain is configured on the LoadMaster. For more information and steps for setting up an SSO Domain, refer to the **Edge Security Pack (ESP) Feature Guide** on the [Documentation page](#).

1. Click **View/Modify Services** in the left-hand navigation.

Virtual IP Address	Prot	Name	Layer	Certificate	Installed	Status	Real Servers	Operation
192.168.10.47:80	tcp	Exchange 2019 HTTPS Offloaded with ESP - HTTP Redirect	L7				Redirect	Modify Delete
192.168.10.47:443	tcp	Exchange 2019 HTTPS Offloaded with ESP	L7	*kempdemo.com	Up		<ul style="list-style-type: none"> Exchange 2019 HTTPS Offloaded with ESP - Authentication Proxy Exchange 2019 HTTPS Offloaded with ESP - ActiveSync Exchange 2019 HTTPS Offloaded with ESP - Autodiscover Exchange 2019 HTTPS Offloaded with ESP - ECP Exchange 2019 HTTPS Offloaded with ESP - EWS Exchange 2019 HTTPS Offloaded with ESP - MAPI Exchange 2019 HTTPS Offloaded with ESP - OAB Exchange 2019 HTTPS Offloaded with ESP - OWA Exchange 2019 HTTPS Offloaded with ESP - PowerShell Exchange 2019 HTTPS Offloaded with ESP - RPC 	Modify Delete

2. Click **Modify** for the **Exchange 2019 HTTPS Offloaded with ESP** Virtual Service on port 443 (or the **Exchange 2019 HTTPS Reencrypted with ESP** if that was selected during the creation).
3. Expand the **SubVSs** section.
4. For each SubVS the following fields must be configured. Click the **set** button next to each field entered.

SubVS Name	Pre-Authorization Excluded Directories	Allowed Virtual Hosts	Logoff String	User Password Form
Authentication Proxy	n/a	Required	n/a	n/a
ActiveSync	n/a	Required	n/a	n/a
API	n/a	n/a	n/a	n/a
Autodiscover	n/a	Required	n/a	n/a
ECP	n/a	Required	n/a	n/a
EWS	n/a	Required	n/a	n/a
MAPI	n/a	Required	n/a	n/a
OAB	n/a	Required	n/a	n/a
OWA	/owa/ <guid@smtpdomain> *1	Required	/owa/logoff.owa	https://<Exchange URL> /owa/auth/ expiredpassword.asp x?url=/owa/auth.owa
PowerShell	n/a	Required	n/a	n/a
RPC	n/a	Required	n/a	n/a

Note: ¹GUID is unique to each Exchange deployment. To find the correct GUID, run the following command on the Exchange Server: **Get-Mailbox -Arbitration | where {\$_.PersistedCapabilities -like "OrganizationCapabilityClientExtensions"} | fl exchangeGUID, primarysmtpaddress**The **Logoff String** must be set to **/owa/logoff.owa** in the OWA SubVS. In a customized environment, if the OWA logoff string has been changed, the modified logoff string must be entered in the **Logoff String** text box. The SSO Greeting Message field accepts HTML code, so the users can insert their own image if desired. The grave accent character (`) is not supported. If this character is entered in the SSO Greeting Message, the character will not display in the output, for example, **a`b`c** becomes **abc**.

HTTPS Pass-through Virtual Service

HTTPS Pass-through Virtual Service

To add the Virtual Services for Exchange HTTPS Pass-through using the template, follow the steps below:

1. Click **Virtual Services**.
2. Click **Add New**.
3. Enter a **Virtual Address**.
4. Select the **Exchange 2019 HTTPS pass-through** template from the **Use Template** drop-down list depending on your preference.
5. Click **Add This Virtual Service**.
6. Expand the **Real Servers** section.
7. Click **Add New**.
8. For the **Real Server Address**, enter the IP Address for one of the Exchange Servers.
9. Click **Add this Real Server**.
10. Add any additional Real Servers as required.

IMAP and IMAPS Virtual Service

IMAP and IMAPS Virtual Service

The steps are the same when using Exchange IMAP and Exchange IMAPS application templates. To add the Virtual Services for Exchange IMAP and Exchange IMAPS using the template, follow the steps below:

1. Click **Virtual Services**.
2. Click **Add New**.
3. Enter a **Virtual Address**.
4. Select the **Exchange 2019 IMAP** or the **Exchange 2019 IMAPS** template from the **Use Template** drop-down list depending on your preference.
5. Click **Add This Virtual Service**.
6. Expand the **Real Servers** section.
7. Click **Add New**.
8. For **Real Server Address**, enter the **IP Address** for one of the Exchange Servers.

9. Click **Add this Real Server**.
10. Add any additional Real Servers as required.

IMAPS Offloaded and IMAP with STARTTLS Virtual Service

IMAPS Offloaded and IMAP with STARTTLS Virtual Service

The steps are the same when using Exchange IMAPS Offloaded and Exchange IMAP with STARTTLS application templates. To add the Virtual Services for Exchange IMAPS Offloaded and Exchange IMAP with STARTTLS using the template, follow the steps below:

1. Click **Virtual Services**.
2. Click **Add New**.
3. Enter a **Virtual Address**.
4. Select the **Exchange 2019 IMAP** or the **Exchange 2019 IMAPS** template from the **Use Template** drop-down list depending on your preference.
5. Click **Add This Virtual Service**.
6. Expand **SSL Properties (Acceleration Enabled)**.

The screenshot shows the 'SSL Properties' configuration page. At the top, there are checkboxes for 'SSL Acceleration' (Enabled), 'Reencrypt', 'Supported Protocols' (SSLv3, TLS1.0, TLS1.1, TLS1.2, TLS1.3), 'Add Received Cipher Name', and 'Require SNI hostname'. Below this is the 'Certificates' section, which includes a 'Self Signed Certificate in use' label, 'Available Certificates' (with 'ExampleCertificate [server]' selected), 'Assigned Certificates' (with 'None Assigned'), and a 'Set Certificates' button. A 'Manage Certificates' link is also present. The 'Ciphers' section shows a 'Cipher Set' dropdown set to 'Default' and a 'Modify Cipher Set' button. Below this is a list of 'Assigned Ciphers' including ECDHE-ECDSA-AES256-GCM-SHA384, ECDHE-RSA-AES256-GCM-SHA384, DHE-DSS-AES256-GCM-SHA384, DHE-RSA-AES256-GCM-SHA384, ECDHE-ECDSA-CHACHA20-POLY1305, and ECDHE-RSA-CHACHA20-POLY1305. The 'TLS1.3 Ciphersets' section has checkboxes for TLS_AES_256_GCM_SHA384, TLS_CHACHA20_POLY1305_SHA256, TLS_AES_128_GCM_SHA256, TLS_AES_128_CCM_8_SHA256, and TLS_AES_128_CCM_SHA256. The 'Client Certificates' section has a dropdown set to 'No Client Certificates required'. The 'Strict Transport Security Header' section has a dropdown set to 'Don't add the Strict Transport Security Header'. The 'Intermediate Certificates' section has a dropdown set to 'Using all installed Intermediate certificates' and a 'Show Intermediate Certificates' link.

7. Select the certificate to use in the **Available Certificates** and click the “arrow” > to move it to **Assigned Certificates**.
8. Click **Set Certificate**.

9. Expand the **Real Servers** section.
10. Click **Add New**.
11. For **Real Server Address**, enter the IP Address for one of the Exchange Servers.

Note: Ensure port 143 is entered in the **Port** field.

12. Click **Add this Real Server**.
13. Add any additional Real Servers as required.

POP and POPS Virtual Service

POP and POPS Virtual Service

The steps are the same when using Exchange POP and Exchange POPS application templates. To add the Virtual Services for Exchange POP and Exchange POPS using the template, follow the steps below:

1. Click **Virtual Services**.
2. Click **Add New**.
3. Enter a **Virtual Address**.
4. Select the **Exchange 2019 POP** or the **Exchange 2019 POPS** template from the **Use Template** drop-down list depending on your preference.
5. Click **Add This Virtual Service**.
6. Expand the **Real Servers** section.
7. Click **Add New**.
8. For the **Real Server Address**, enter the IP Address for one of the Exchange Servers.
9. Click **Add this Real Server**.
10. Add any additional Real Servers as required.

POPS Offloaded and POP with STARTTLS Virtual Service

POPS Offloaded and POP with STARTTLS Virtual Service

The steps are the same when using Exchange IMAPS Offloaded and Exchange IMAP with STARTTLS application templates. To add the Virtual Services for Exchange IMAPS Offloaded and Exchange IMAP with STARTTLS using the template, follow the steps below:

1. Click **Virtual Services**.
2. Click **Add New**.
3. Enter a **Virtual Address**.
4. Select the **Exchange 2019 IMAP** or the **Exchange 2019 IMAPS** template from the **Use Template** drop-down list depending on your preference.
5. Click **Add This Virtual Service**.

6. Expand **SSL Properties (Acceleration Enabled)**.

7. Select the certificate to use in the **Available Certificates** and click the “arrow” > to move it to **Assigned Certificates**.
8. Click **Set Certificate**.
9. Expand the **Real Servers** section.
10. Click **Add New**.
11. For the **Real Server Address**, enter the IP Address for one of the Exchange Servers.

Note: Ensure port 110 is entered in the **Port** field.

12. Click **Add this Real Server**.
13. Add any additional Real Servers as required.

SMTP and SMTPS Virtual Service

SMTP and SMTPS Virtual Service

The steps are the same when using Exchange SMTP and Exchange SMTPS application templates. To add the Virtual Services for Exchange SMTP and Exchange SMTPS using the template, follow the steps below:

1. Click **Virtual Services**.
2. Click **Add New**.
3. Enter a **Virtual Address**.

4. Select the **Exchange 2019 SMTP** or the **Exchange 2019 SMTPS** template from the **Use Template** drop-down list depending on your preference.
5. Click **Add This Virtual Service**.
6. Expand the **Real Servers** section.
7. Click **Add New**.
8. For the **Real Server Address**, enter the IP Address for one of the Exchange Servers.
9. Click **Add this Real Server**.
10. Add any additional Real Servers as required.

SMTPS Offloaded and SMTP with STARTTLS Virtual Service

SMTPS Offloaded and SMTP with STARTTLS Virtual Service

The steps are the same when using Exchange SMTPS Offloaded and Exchange SMTP with STARTTLS application templates. To add the Virtual Services for Exchange SMTPS Offloaded and Exchange SMTP with STARTTLS using the template, follow the steps below:

1. Click the **Add New button**.
2. Enter a **Virtual Address**.
3. Select the **Exchange 2019 SMTP** or the **Exchange 2019 SMTPS** template from the **Use Template** drop-down list depending on your preference.
4. Click **Add This Virtual Service**.
5. Expand **SSL Properties (Acceleration Enabled)**.

SSL Properties

SSL Acceleration Enabled: ☒ Reencrypt: ☐

Supported Protocols ☐ SSLv3 ☐ TLS1.0 ☒ TLS1.1 ☒ TLS1.2 ☒ TLS1.3

Add Received Cipher Name ☐

Require SNI hostname ☐

Certificates

Self Signed Certificate in use.

Available Certificates: ExampleCertificate [server]

Assigned Certificates: None Assigned

Ciphers

Cipher Set: Default Modify Cipher Set

Assigned Ciphers:

- ECDHE-ECDSA-AES256-GCM-SHA384
- ECDHE-RSA-AES256-GCM-SHA384
- DHE-DSS-AES256-GCM-SHA384
- DHE-RSA-AES256-GCM-SHA384
- ECDHE-ECDSA-CHACHA20-POLY1305
- ECDHE-RSA-CHACHA20-POLY1305

TLS1.3 Ciphersets:

- ☒ TLS_AES_256_GCM_SHA384 ☒ TLS_CHACHA20_POLY1305_SHA256 ☒ TLS_AES_128_GCM_SHA256
- ☐ TLS_AES_128_CCM_8_SHA256 ☐ TLS_AES_128_CCM_SHA256

Client Certificates

No Client Certificates required

Strict Transport Security Header

Don't add the Strict Transport Security Header

Intermediate Certificates

Using all installed Intermediate certificates

Show Intermediate Certificates

6. Select the certificate to use in the **Available Certificates** and click the “arrow” > to move it to **Assigned Certificates**.
7. Click **Set Certificate**.
8. Expand the **Real Servers** section.
9. Click **Add New**.
10. For the **Real Server Address**, enter the IP Address for one of the Exchange Servers.

Note: Ensure port 25 is entered in the **Port** field.

11. Click **Add this Real Server**.
12. Add any additional Real Servers as required.

Note: SMTPS can be configured as offloaded as outlined above but cannot be set to Reencrypt.

SMTP with ESP Virtual Service

SMTP with ESP Virtual Service

To add the Virtual Services for Exchange 2019 SMTP with ESP using the template, follow the steps below:

1. Click the **Add New** button.
2. Enter a **Virtual Address**.

3. Select the **Exchange 2019 SMTP with ESP** template from the **Use Template** drop-down list depending on your preference.
4. Click **Add This Virtual Service**.
5. Expand **ESP Options**.

6. Enter the Permitted SMTP Domain for the Organization and click **Set Permitted Domains**.
7. Expand the **Real Servers** section.
8. Click **Add New**.
9. For the Real Server Address, enter the IP Address for one of the Office Online Servers.
10. Click **Add this Real Server**.
11. Add any additional Real Servers as necessary.

Office Online Server Virtual Service

Office Online Server Virtual Service

To add the Virtual Services for Office Online Server using the template, follow the steps below:

1. Click the **Add New** button.
2. Enter a **Virtual Address**.
3. Select the **Exchange 2019 Office Online Server** template from the **Use Template** drop-down list depending on your preference.
4. Click **Add This Virtual Service**.
5. Expand **SSL Properties (Acceleration Enabled)**.
