Introduction

Introduction

As part of the Edge Security Pack (ESP), the LoadMaster supports the RSA SecurID authentication scheme. This scheme authenticates the user on an RSA SecurID Server. When RSA is enabled as the authentication method, during the login process the user is prompted to enter a password that is a combination of two numbers – a Personal Identification Number (PIN) and a token code which is the number displayed on the RSA SecurID authenticator (dongle).

There are two additional challenge-response modes: next token and new PIN. These are described in the sections below.

The above diagram shows both next token and new pin modes which are only applicable under the conditions described below. This flow allows for three login attempts, after which login failure is final. The actual number of login attempts users are allowed to have is configurable.

Next Token Mode

Next Token Mode

Next token mode is applied in cases where the authentication process requires additional verification of the token code. The user is asked to enter the next token code, that is, wait for the number that is currently displayed on the authenticator to change, and enter the new number (without the PIN).

Note: When using RSA and Kerberos Constrained Delegation (KCD), the user password will not be authenticated which may result in unsecured access – particularly if RSA operates in token code only mode. While many RSA implementations use token code and PIN, others just use token code.

New PIN Mode

New PIN Mode

New PIN mode is applied in cases where the authentication process requires additional verification of the PIN. In this case, the user must use a new PIN. Depending on the configuration of the RSA ACE/Server, the user is prompted to select and enter a new PIN, or the server supplies the user with a new PIN. The user then re-authenticates with the new PIN. The use of new PIN mode is optional and can be enabled or disabled in the authentication server.

Document Purpose

Document Purpose

This document describes how to configure the LoadMaster to use the RSA two factor authentication method.

The RSA Security Console screenshots and steps in this document are examples. Progress Kemp will not be notified of any changes made in the RSA Security Console so please refer to the RSA documentation for the latest information, if needed.

Intended Audience

Intended Audience

This document is intended to be read by anyone who is interested in finding out how to use RSA authentication with the LoadMaster.

Prerequisites

Prerequisites

The following are required in order to use RSA as an authentication method:

- A configured RSA SecurID Server

Note: The LoadMaster can only use one RSA server at a time.

- RSA Authentication Manager 8.1
- SecurID dongles

Configure RSA SecurID Multi-Factor Authentication

Configure RSA SecurID Multi-Factor Authentication

You need to complete three steps in order to configure RSA multi-factor authentication on the LoadMaster. These are outlined in the sections below.

If multiple domains are configured, sign-on can then be authenticated all at once. More information on this option can be found in [ESP, Feature Description](#).

Generate an Authentication Agent Entry

Generate an Authentication Agent Entry

An Authentication Agent Entry needs to be generated for the LoadMaster in the RSA Authentication Manager. To do this, in the RSA Security Console, follow the steps below:

The screenshot shows the RSA Security Console interface. The top navigation bar includes links for Home, Identity, Authentication, Access, Reporting, RADIUS, and Administration. The 'Access' menu is expanded, showing 'Active User Sessions' and 'Authentication Agents'. The 'Authentication Agents' dropdown is open, displaying options: 'Manage Existing', 'Add New', 'Generate Configuration File', 'Download Server Certificate File', and 'Authentication Manager Contact List'. On the left, a 'Generate Configuration File' button is visible, and a message states: 'Your file was successfully generated and is ready to download.' Below this, a green checkmark icon is followed by the text: 'The configuration file was successfully generated and is ready to download.'

1. Select **Access > Authentication Agents** and click **Add New**.

The screenshot shows the 'Authentication Agent Basics' configuration form. It includes the following fields and controls:

- Hostname:** A text box containing 'LM-101' with a 'Resolve IP' button to its right.
- Existing node:** A dropdown menu with the text '-- Choose One --'.
- IP Address:** A text box containing '192.168.1.101' with a 'Resolve Hostname' button below it.
- Protect IP Address:** A checkbox that is checked, with the label 'Prevent auto registration from unassigning IP address'.
- Alternate IP Addresses:** A section with an 'IP Address' label, a text box, and 'Add' and 'Update' buttons. Below this is a list box containing one empty entry with a 'Remove' button.
- Notes:** A large text area at the bottom for additional notes.

2. Enter the LoadMaster IP address in the **IP Address** text box.

Note: For a HA cluster, add all three LoadMaster IP addresses (unit 1, unit 2 and the shared IP address).

Note: If the source IP address of traffic from the LoadMaster to the RSA server changes as a result of interface IP changes or routing changes, please note that a new RSA-Config file will need to be generated.

3. Click the **Resolve Hostname** button. The **Hostname** field will auto-populate.
4. Fill out the remaining fields as required on the form.
5. Click **Save**.

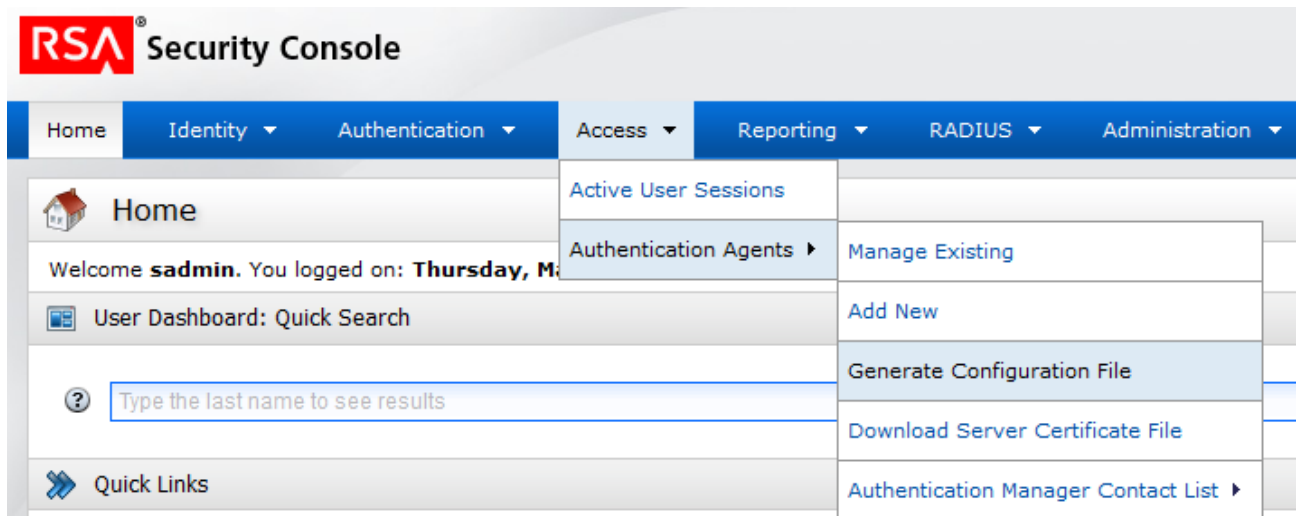

A message will appear confirming that the agent was added.

Export the Authentication Manager Configuration

Export the Authentication Manager Configuration

Before uploading the Authentication Manager configuration, it needs to be exported from the RSA Security Console. To do this, follow the steps below:

1. Select **Access > Authentication Agents** and click **Generate Configuration File**.

1. Click **Generate Config File**.

Download File

The file is ready to download. When prompted, select **Save it to disk** to save the ZIP file to your local machine.

Filename: AM_Config.zip

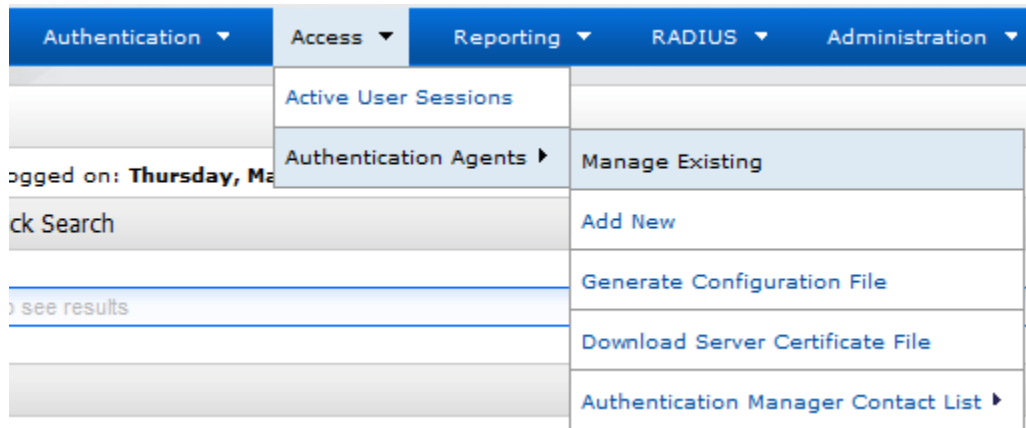

Download: [Download Now](#)

1. Click **Download Now** to download the configuration file.

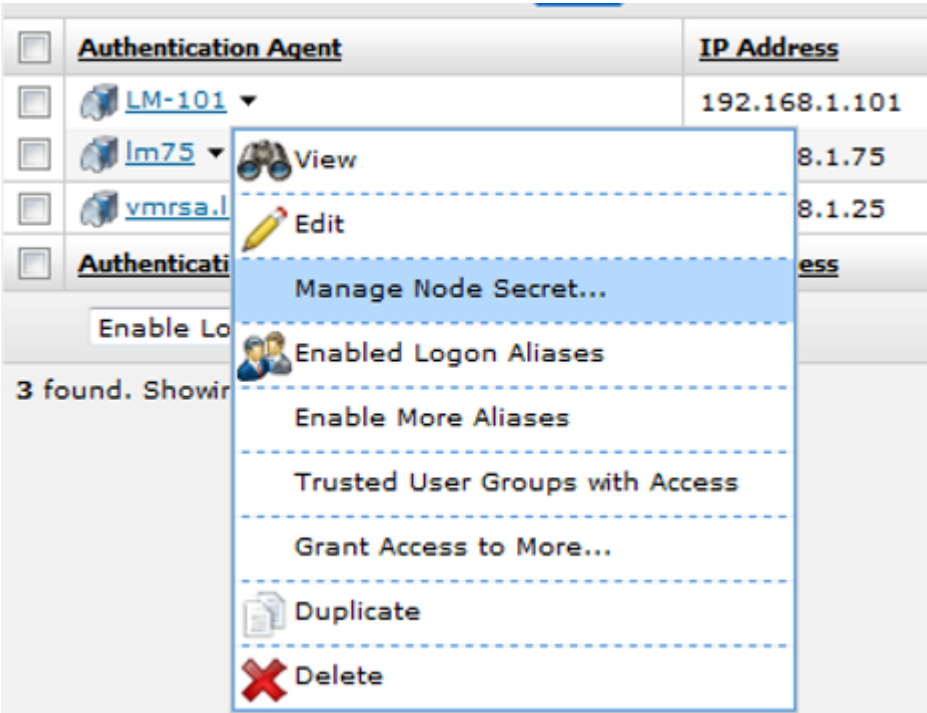

Generate a Node Secret File

Generate a Node Secret File

First, generate a Node Secret in the RSA Security Console by following the steps below:

1. Select **Access > Authentication Agents > Manage Existing**.

1. Right click the LoadMaster entry and click **Manage Node Secret**.

Node Secret Basics

Node Secret Set:
No

?
Clear Node Secret:

☐ Clear the node secret

?
Create Node Secret:

☒ Create a new random node secret, and export the node secret to a file

?
Encryption Password:

*

Confirm Encryption Password:

*

Cancel
Save

1. Select the **Create a new random node secret, and export the node secret to a file** check box.
2. Enter an **Encryption Password** for the node secret file.
3. Confirm the encryption password.
4. Click **Save**.

Download File

The file is ready to download. When prompted, select **Save it to disk** to save the ZIP file to your local machine.

Filename:
LM-101_NodeSecret.zip

Download:
[Download Now](#)

1. Click **Download Now**.

1. Save the file.

Configure the LoadMaster

Configure the LoadMaster

Note: The LoadMaster can only use one RSA server at a time.

In the LoadMaster Web User Interface (WUI), follow the steps below:

1. In the main menu, select **Virtual Services** and **Manage SSO**.

Note: For steps on how to configure an SSO domain and ESP, refer to the [ESP, Feature Description](#) document.

Name	Operation
DOMAIN	<div>Modify</div> <div>Delete</div>

Add new Client Side Configuration

Add

2. Click **Modify** on the relevant SSO domain.

Domain DOMAIN

Authentication Protocol	<input type="text" value="RSA-SecurID"/>	
RSA-SecurID Server(s)	<input type="text" value="10.154.11.52"/>	<input type="button" value="Set RSA-SecurID Server(s)"/>
RSA Authentication Manager Config File	<input type="button" value="Choose File"/> No file chosen	<input type="button" value="Set RSA AM Config"/>
RSA Node Secret File	<input type="button" value="Choose File"/> No file chosen	<input type="button" value="Set RSA Node Secret"/>
	<input type="text"/> Decryption Password	
Domain/Realm	<input type="text"/>	<input type="button" value="Set Domain/Realm Name"/>
Logon Format (Phase 1 RSA-SecurID)	<input type="text" value="Principalname"/>	
Logon Format (Phase 2 Real Server)	<input type="text" value="Principalname"/>	
Logon Transcode	<input type="text" value="Disabled"/>	
Failed Login Attempts	<input type="text" value="0"/>	<input type="button" value="Set Failed Login Attempts"/>
	Public - Untrusted Environment	Private - Trusted Environment
	<input type="text" value="900"/>	<input type="text" value="900"/>
	<input type="button" value="Set Idle Time"/>	<input type="button" value="Set Idle Time"/>
Session Timeout	<input type="text" value="1800"/>	<input type="text" value="28800"/>
	<input type="button" value="Set Max Duration"/>	<input type="button" value="Set Max Duration"/>
	Use for Session Timeout: <input type="text" value="idle time"/>	
Test User	<input type="text"/>	<input type="button" value="Set Test User"/>
Test User Password	<input type="text"/>	<input type="button" value="Set Test User Password"/>

3. Select RSA-SecurID as the Authentication protocol.

Note: It is also possible to select **RSA-SecurID** and **LDAP** as the **Authentication Protocol**. If this is selected, the **LDAP Endpoint** will also need to be selected.

4. In the **RSA-SecurID Server(s)** text box, enter the address(es) of the RSA-SecurID server(s) that are used to validate this domain.
5. Click **Set RSA-SecurID Server(s)**.
6. In the **RSA Authentication Manager Config File** field, click **Choose File**.
7. Browse to and select the file exported in the [Export the Authentication Manager Configuration](#) section.
8. Click **Set RSA AM Config**.
9. Enter the login domain to be used in the **Domain/Realm** text box.

Note: This is also used with the logon format to construct the normalized username, for example; - **Principalname:** <username>@<domain> - **Username:** <domain>\<username>

Note: If the **Domain/Realm** field is not set, the **Domain** name set when initially adding an SSO domain is used as the **Domain/Realm** name.

10. Select the relevant option for **Logon Format (Phase 1 RSA-SecurID)**.
11. Select the relevant option for **Logon Format (Phase 2)**.

Note: The different logon formats are described below: - **Not Specified:** The username will have no normalization applied to it - it is taken as it is typed. - **Principalname:** Selecting this as the **Logon format** means that the client does not need to enter the domain when logging in, for example **username@domain**. The SSO domain added in the corresponding text box is used as the domain in this case. - **Username:** Selecting this as the **Logon format** means that the client needs to enter the domain

and username, for example **domain\username**. - **Username Only**: Selecting this as the **Logon Format** means that the text entered is normalized to the username only (the domain is removed).

12. Enter the **Test User** and click **Set Test User**.

13. Enter the **Test User Password** and click **Set Test User Password**.

Note: The LoadMaster will use this test information in a health check of the SecurID Server. These details are static and should be set in the RSA management WUI. This health check is performed every 20 seconds.

Upload a Node Secret File for the LoadMaster

Upload a Node Secret File for the LoadMaster

Upload the node secret in the LoadMaster. In the Manage SSO screen on the LoadMaster WUI, follow the steps below:

Domain DOMAIN

Authentication Protocol	<input type="text" value="RSA-SecurID"/>	
RSA-SecurID Server(s)	<input type="text" value="10.11.0.231"/>	Set RSA-SecurID Server(s)
RSA Authentication Manager Config File	Choose File No file chosen	Set RSA AM Config
RSA Node Secret File	Choose File No file chosen	Set RSA Node Secret
	<input type="text"/> Decryption Password	
Domain/Realm	<input type="text"/>	Set Domain/Realm Name
Logon Format (Phase 1 RSA-SecurID)	<input type="text" value="Principalname"/>	
Logon Format (Phase 2 Real Server)	<input type="text" value="Principalname"/>	
Logon Transcode	<input type="text" value="Disabled"/>	
Failed Login Attempts	<input type="text" value="0"/>	Set Failed Login Attempts
	Public - Untrusted Environment	Private - Trusted Environment
	<input type="text" value="900"/>	<input type="text" value="900"/>
	Set Idle Time	Set Idle Time
Session Timeout	<input type="text" value="1800"/>	<input type="text" value="28800"/>
	Set Max Duration	Set Max Duration
	Use for Session Timeout: <input type="text" value="idle time"/>	
Test User	<input type="text"/>	Set Test User
Test User Password	<input type="text"/>	Set Test User Password

1. In the **RSA Node Secret File** field, click **Choose File**.

2. Browse to and select the Node Secret file generated in the [Generate a Node Secret File](#) section.

Note: It is not possible to upload the RSA node secret file until the RSA Authentication Manager configuration file is uploaded. The node secret file is dependent on the configuration file.

1. Enter the **Decryption Password**.
2. Click **Set RSA Node Secret**.

Set the L7 Client Token Timeout Value

Set the L7 Client Token Timeout Value

The L7 Client Token Timeout is the duration of time (in seconds) to wait for the client token while the process of authentication is ongoing. The default L7 client token timeout is set to 120 seconds. This can be modified as needed in the LoadMaster WUI. The range of valid values is 60 to 300. To configure the timeout value, follow the steps below:

1. In the main menu, go to **System Configuration > Miscellaneous Options > L7 Configuration**.

Allow connection scaling over 64K Connections	<input type="checkbox"/>
Always Check Persist	<input type="text" value="No"/>
Add Port to Active Cookie	<input type="checkbox"/>
Conform to RFC	<input checked="" type="checkbox"/>
Close on Error	<input type="checkbox"/>
Add Via Header In Cache Responses	<input type="checkbox"/>
Real Servers are Local	<input type="checkbox"/>
Drop Connections on RS failure	<input type="checkbox"/>
Drop at Drain Time End	<input type="checkbox"/>
L7 Connection Drain Time (secs)	<input type="text" value="300"/> Set Time (Valid values:0, 60 - 86400)
L7 Authentication Timeout (secs)	<input type="text" value="30"/> Set Timeout (Valid values:30 - 300)
L7 Wait after POST(ms)	<input type="text" value="2000"/> Set Post Wait (Valid values:1 - 2000)
L7 Client Token Timeout (secs)	<input type="text" value="120"/> Set Timeout (Valid values:60 - 300)
Additional L7 Header	<input type="text" value="X-Forwarded-For"/>
100-Continue Handling	<input type="text" value="RFC-7231 Compliant"/>
Allow Empty POSTs	<input type="checkbox"/>
Allow Empty HTTP Headers	<input type="checkbox"/>
Force Complete RS Match	<input type="checkbox"/>
Least Connection Slow Start	<input type="text" value="0"/> Set Slow Start (Valid values:0 - 600)
Share SubVS Persistence	<input type="checkbox"/>
Log Insight Message Split Interval	<input type="text" value="10"/> Set Log Split Interval (Valid values:1 - 100)
Include User Agent Header in User Logs	<input type="checkbox"/>
Use CEF Log Format	<input type="checkbox"/>
SSO Maximum Threads	<input type="text" value="128"/> Set SSO Max Threads (Valid values:64 - 512)
NTLM Proxy Mode	<input checked="" type="checkbox"/>

2. Enter the new value in the **L7 Client Token Timeout** text box and click **Set Timeout**.

Create a Virtual Service

Create a Virtual Service

Follow the steps below to create a Virtual Service in the LoadMaster WUI:

1. In the main menu, expand **Virtual Services** and click **Add New**.

Please Specify the Parameters for the Virtual Service.

Virtual Address	<input type="text" value="10.154.11.182"/>
Port	<input type="text" value="80"/>
Service Name (Optional)	<input type="text" value="Example"/>
Use Template	<input type="text" value="Select a Template"/>
Protocol	<input type="text" value="tcp"/>

2. Enter a valid **Virtual Address**.
3. Fill out any other details as needed.
4. Click **Add this Virtual Service**.
5. Expand the **ESP Options** section.
