Introduction

Introduction

Web Application Firewall (WAF) services are natively integrated in the LoadMaster. This enables secure deployment of web applications, preventing Layer 7 attacks while maintaining core load balancing services which ensures superior application delivery and security. WAF functionality directly augments the LoadMaster's existing security features to create a layered defence for web applications - enabling a safe, compliant and productive use of published services.

If you have a WAF license and WAF Support, Progress Kemp provides a number of commercial rules, such as **ip_reputation**. These commercial rules are targeted to protect against specific threats. The Progress Kemp-provided commercial rules are available when signed up to a WAF subscription.

You can also upload other rules such as the ModSecurity core rule set which contains generic attack detection rules that provide a base level of protection for any web application.

You can also write and upload your own custom rules, if required.

With the WAF-enabled LoadMaster, you can choose whether to use Progress Kemp-provided rules, custom rules which can be uploaded or a combination of both.

For a more detailed overview of the WAF feature, please refer to the WAF section in the [LoadMaster, Product Overview](#).

For instructions on how to configure the various WAF options in the LoadMaster, refer to the [Web Application Firewall, Feature Description](#).

Document Purpose

Document Purpose

The purpose of this document is to provide some guidance on how to write your own custom WAF rules. These custom rules can be uploaded to the LoadMaster and assigned to Virtual Services as needed.

Intended Audience

Intended Audience

This document is intended to be read by anyone who is interested in finding out more about how to write custom WAF rules.

ModSecurity Rule Writing

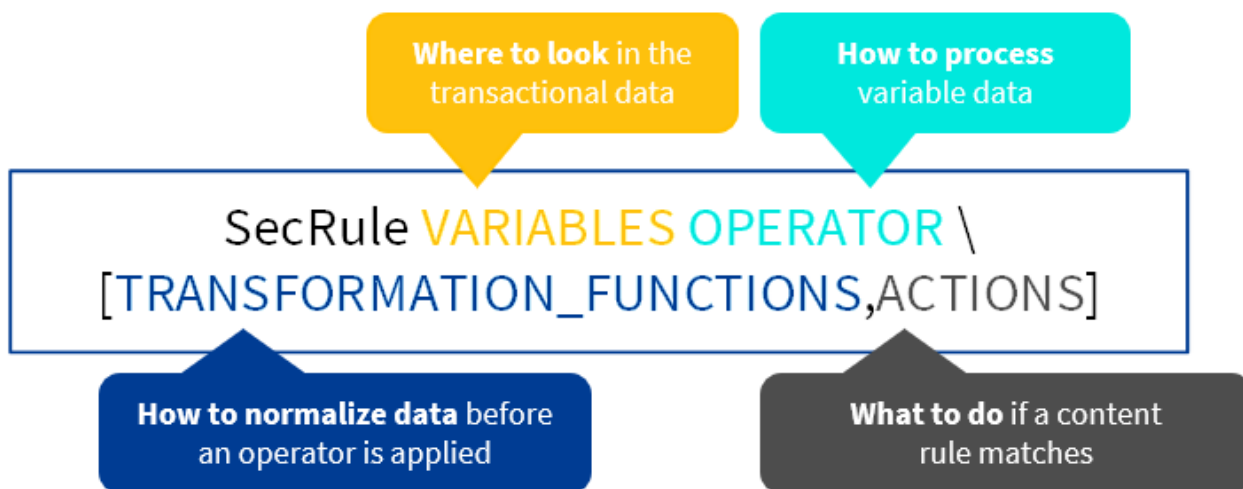

ModSecurity Rule Writing

The ModSecurity Reference Manual should be consulted in any cases where questions arise relating to the syntax of commands: <https://github.com/SpiderLabs/ModSecurity/wiki/Reference-Manual>

In terms of rule writing, the main directive to know is SecRule, which is used to create rules and thus does most of the work.

Every rule defined by SecRule conforms to the same format, as below:

```
SecRule VARIABLES OPERATOR \ [TRANSFORMATION_FUNCTIONS,ACTIONS]
```

The rule consists of four parts:

- **VARIABLES:** Tells the WAF engine where to look in the transactional data.
- **OPERATOR:** Tells the WAF engine how to process the variable data.
- **TRANSFORMATION_FUNCTIONS:** Tells the WAF engine how to normalize data before an operator is applied.
- **ACTIONS:** Tells the WAF engine what to do if a rule matches.

The four parts are explained in the sections below.

- [Actions](#)
- [Rule Syntax](#)
- [WUI Settings](#)
- [Rule Block Function](#)

Variables

Variables

This specifies which places to check in a HTTP transaction. Examples of variables include:

- **ARGS** – all arguments including the POST payload
- **REQUEST_METHOD** – request method used in the transaction
- **REQUEST_HEADERS** – can be used as either a collection of all of the request headers or can be used to inspect selected headers
- Etc. The full list of variables is available here: <https://github.com/SpiderLabs/ModSecurity/wiki/Reference-Manual#Variables>

Operator

Operator

This specifies a regular expression, pattern or keyword to be checked in the variable(s). Operators begin with the @ character. The full list of operators is available here: <https://github.com/SpiderLabs/ModSecurity/wiki/Reference-Manual#Operators>

Transformation Functions

Transformation Functions

There are a number of transformation functions that can be performed, for example:

- Anti-evasion (such as lowercase, normalisePath, removeNulls, replaceComments, compressWhitespace)
- Decoding (such as base64Decode, hexDecode, jsDecode, urlDecodeUni)
- Encoding (such as base64Encode, hexEncode)
- Hashing (such as sha1, md5)

Actions

Actions

This specifies what to do if the rule matches. Actions are defined in seven categories, listed below:

- **Disruptive** – used to allow ModSecurity to take an action, for example allow or block
- **Flow** – affect the flow, for example skip
- **Meta-data** – used to provide more information about rules
- **Variable** – used to set, change and remove variables
- **Logging** – used to influence the way logging takes place
- **Special** – used to provide access to another class of functionality
- **Miscellaneous** – contain actions that do not belong in any other groups.

If no actions are provided, default actions apply as per **SecDefaultAction (phase:2,log,auditlog,pass)**. The full list of actions are available here:

<https://github.com/SpiderLabs/ModSecurity/wiki/Reference-Manual#Actions>

When constructing the rules, you can specify at what phase the rule should run. Specifying the correct phase can be beneficial in order to reduce CPU processing.

Rule Syntax

Rule Syntax

The following rule looks at the request Uniform Resource Identifier (URI) and tries to match the regular expression pattern `<script>` against it. The double quotes are used because the second parameter contains a space:

```
SecRule REQUEST_URI "@rx <script>"
```

To split a long line into two, use a single backslash character, followed by a new line:

```
SecRule ARGS KEYWORD \  
phase:1,t:none,block
```

Multiple variables can be used in a rule as long as they are separated using the pipe character, for example:

```
SecRule REQUEST_URI|REQUEST_PROTOCOL <script>
```

The **SecDefaultAction** directive is used if no actions are defined for a rule. For example, the following rule:

```
SecRule ARGS D1
```

Is equivalent to:

```
SecRule ARGS D1 phase2:log:auditlog,pass
```

- [Rule Example 1 – Cross Site Scripting \(XSS\) Attack](#)
- [Rule Example 2 – Whitelist IP Address](#)
- [Rule Example 3 – Chaining Rules](#)
- [Rule Example 4 – Shellshock Bash Attack](#)

Rule Example 1 – Cross Site Scripting (XSS) Attack

Rule Example 1 – Cross Site Scripting (XSS) Attack

The following rule is used to avoid XSS attacks by checking for a <script> pattern in the request parameters and header and generates an ‘XSS Attack’ message with a 404 status response.

```
SecRule ARGS|REQUEST_HEADERS "@rx <script>" id:101,msg: 'XSS  
Attack',severity:ERROR,deny,status:404
```

Variables

Details about the variables in this rule example are in the table below:

Variable	Definition
ARGS	Request parameters
REQUEST_HEADERS	All of the request headers

Operator

“@rx <script>” – Performs a regular expression match of the pattern (in this case <script>) provided as a parameter.

Actions

Details of the actions contained in this rule example are provided in the table below:

Action(s)	Description
id, msg, severity, deny, status	These are all of the actions to be performed if the pattern is matched.
id:101	The unique ID that is assigned to the rule (or chain) in which it appears.
msg: “XSS Attack”	The custom message (i.e. XSS Attack) assigned to the rule (or chain) in which it appears.
severity:ERROR	<p>The severity of the rule. Severities include:</p> <ul style="list-style-type: none"> • EMERGENCY (0) • ALERT (1) • CRITICAL (2) • ERROR (3) • WARNING (4) • NOTICE (5) • INFO (6) • DEBUG (7)
deny	This stops rule processing and intercepts transaction. This is a disruptive action.
status:404	This specifies the response status code (404) with actions deny and redirect.

Rule Example 2 – Whitelist IP Address

The following example shows how to whitelist an IP address to bypass the ModSecurity engine:

```
secRule REMOTE_ADDR "@ipMatch 192.168.1.101" \
id:102,phase:1,t:none,nolog,pass,ctl:ruleEngine=off
```

Variables

Variable Name: REMOTE_ADDR

Variable Definition: The IP address of the remote client

Note: Rules listing IP addresses with the /32 subnet mask are not supported and will not upload successfully.

Operator

“@ipMatch 192.168.1.101” – Performs an IPv4 or IPv6 match of the REMOTE_ADDR variable data. In this case – this is the whitelisted IP address.

Actions

Action(s)	Description
id:101	The unique ID that is assigned to the rule (or chain) in which it appears.
phase:1	Places the rule (or chain) in Phase 1 processing. There are five phases, including: <ul style="list-style-type: none">• Request Headers (1)• Request Body (2)• Response Headers (3)• Response Body (4)• Logging (5)
t:none	Indicates that no action is used to transform the value of the variable used in the rule before matching. For example, t:utf8toUnicode converts all UTF-8 character sequences to Unicode to assist in input normalization.

Action(s)	Description
nolog	Prevents rule matches from appearing in both the error and audit logs.
pass	Continues processing with the next rule in spite of a successful match.
ctl:ruleEngine=off	This action changes ModSecurity configuration on a transient, per-transaction basis. This only affects the transaction in which the action is executed. In this case, the ModSecurity rule engine is turned off.

Rule Example 3 – Chaining Rules

Rule Example 3 – Chaining Rules

Chained rules allow for more complex rule matches where a number of different VARIABLES are used to create a better rule and to help prevent false positives. In programming language concepts – think of chained rules as somewhat similar to AND conditional statements. The actions specified in the first portion of the chained rule will only be triggered if all of the variable checks return positive hits. If one aspect of the chained rule is negative, then the entire rule chain is negative. The most unique portion should be specified on the first line – this will reduce the number of “normal” requests that will have to be evaluated against the rest of the chained rule set.

In addition to using a number of different VARIABLES in the one rule, it is also possible to chain more than one rule. Below is an example of chaining two rules. In this example, the first rule checks if the username (**ARGS:username**) for the string admin (**streq admin**) using a string comparison. If the first rule holds true, the second rule is activated which denies all requests that are not from the REMOTE_ADDR 192.168.1.111 IP Address (**!streq 192.168.1.111**).

```
SecRule ARGS:username "@streq admin" chain,deny
SecRule REMOTE_ADDR "!streq 192.168.1.111"
```

Rule Example 4 – Shellshock Bash Attack

Rule Example 4 – Shellshock Bash Attack

This section shows an example of the rules required to mitigate the Shellshock Bash attack. There are two rules needed in this case. Details of both rules are provided in the sections below.

First Rule

This is the first rule:

```

SecRule REQUEST_LINE|REQUEST_HEADERS|REQUEST_HEADERS_NAMES "@contains () {"
"phase:1,id:'2100080',block,t:none,t:utf8toUnicode,t:urlDecodeUni,t:compressWh
itespace,msg:'SLR: Bash ENV Variable Injection
Attack',tag:'CVE-2014-6271',tag:'http://cve.mitre.org/cgi-bin/cvename.cgi?
name=CVE-2014-6271',tag:'https://securityblog.redhat.com/2014/09/24/bash-
specially-crafted-environment-variables-code-injection-attack/'"

```

Variables

Details about the variables in this example rule are provided in the table below:

Variable	Definition
REQUEST_LINE	This variable holds the complete request line sent to the server (including the request method and HTTP version information).
REQUEST_HEADERS	All of the request headers
REQUEST_HEADERS_NAMES	All of the names of the request headers.

Operator

"@contains () {" - Checks the REQUEST_LINE|REQUEST_HEADERS|REQUEST_HEADERS_NAMES variables for the string '()' {' and returns true if found.

Actions

Action(s)	Description
phase:1	<p>Places the rule (or chain) in Phase 1 processing. There are five phases, including:</p> <ul style="list-style-type: none"> • Request Headers (1) • Request Body (2) • Response Headers (3) • Response Body (4) • Logging (5)

Action(s)	Description
<code>id:'2100080'</code>	The unique ID that is assigned to this rule (or chain) in which it appears.
<code>block</code>	This performs the disruptive action defined by the previous <code>SecDefaultAction</code> . This allows rule writers to request a blocking action without specifying how the blocking is to be done. The <code>SecRuleUpdateActionById</code> directive allows you to override how a rule handles blocking. Please refer to the Rule Block Function section for further details.
<code>t:none</code>	Indicates that no action is used to transform the value of the variable used in the rule before matching.
<code>t:utf8toUnicode</code>	Converts all UTF-8 character sequences to Unicode to assist in input normalization.
<code>t:urlDecodeUni</code>	Decodes a URL-encoded input string with support for the Microsoft-specific %u encoding.
<code>t:compressWhitespace</code>	Converts any of the whitespace characters (0x20, \f, \t, \n, \r, \v, 0xa0) to spaces (ASCII 0x20), compressing multiple consecutive space characters into one.
<code>msg:'sLR: Bash ENV Variable Injection Attack',tag:'CVE-2014-6271'</code>	The custom message (i.e. XSS Attack) assigned to the rule (or chain) in which it appears.
<code>tag:'http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-6271'</code> <code>tag:'https://securityblog.redhat.com/2014/09/24/bash-specially-crafted-environment-variables-code-injection-attack/'</code>	Assigns a tag (category) to a rule (or chain). This is metadata allows easy automated categorization of events. Multiple tags can be specified on the same rule.

Second Rule

The second rule is as follows:

```
secRule REQUEST_BODY "@contains () {"  
  "phase:2,id:'2100081',block,t:none,t:utf8toUnicode,t:urlDecodeUni,t:compressWh  
  itespace,msg:'SLR: Bash ENV Variable Injection  
  Attack',tag:'CVE-2014-6271',tag:'http://cve.mitre.org/cgi-bin/cvename.cgi?  
  name=CVE-2014-6271',tag:'https://securityblog.redhat.com/2014/09/24/bash-  
  specially-crafted-environment-variables-code-injection-attack/'"
```

Variables

Variable Name: REQUEST_BODY

Variable Definition: All of the request body.

Operator

"@contains () {" – Checks the **REQUEST_BODY** variable for the string **() {** and returns true if found.

Actions

Action(s)	Description
phase:2	Places the rule (or chain) in Phase 2 processing. There are five phases, including: <ul style="list-style-type: none">• Request Headers (1)• Request Body (2)• Response Headers (3)• Response Body (4)• Logging (5)
id:'2100081'	The unique ID that is assigned to this rule (or chain) in which it appears.
block	This performs the disruptive action defined by the previous SecDefaultAction. This allows rule writers to request a blocking action, but without specifying how the blocking is to be done. The SecRuleUpdateActionById directive allows you to override how a rule handles blocking. Please refer to the Rule Block Function section for further details.

Action(s)	Description
<code>t:none</code>	Indicates that no action is used to transform the value of the variable used in the rule before matching.
<code>t:utf8toUnicode</code>	Converts all UTF-8 character sequences to Unicode to assist in input normalization.
<code>t:urlDecodeUni</code>	Decodes a URL-encoded input string with support for the Microsoft-specific %u encoding.
<code>t:compressWhitespace</code>	Converts any of the whitespace characters (0x20, \f, \t, \n, \r, \v, 0xa0) to spaces (ASCII 0x20), compressing multiple consecutive space characters into one.
<code>msg:'SLR: Bash ENV Variable Injection Attack',tag:'CVE-2014-6271'</code>	The custom message (i.e. XSS Attack) assigned to the rule (or chain) in which it appears.
<code>tag:'http://cve.mitre.org/cgi-bin/cvename.cgi?name=CVE-2014-6271'</code> <code>tag:'https://securityblog.redhat.com/2014/09/24/bash-specially-crafted-environment-variables-code-injection-attack/'</code>	Assigns a tag (category) to a rule (or chain). This is metadata which allows easy automated categorization of events. Multiple tags can be specified on the same rule.

WUI Settings

WUI Settings

In the LoadMaster Web User Interface (WUI), WAF settings can be configured for each individual Virtual Service.

Note: The Legacy WAF functionality is not available on new LoadMaster deployments of firmware version 7.2.59 or above. If you have upgraded from a pre-7.2.59 version to 7.2.59 the Legacy WAF functionality remains available.

CAUTION: The legacy WAF Options (**WAF Options (Legacy)**) will be fully deprecated as part of the v7.2.61 release. Deprecated means that Progress Kemp intend to fully remove **WAF Options (Legacy)** from the LoadMaster. If you are running **WAF Options (Legacy)** and upgrade to the v7.2.61 release, a warning will be

provided and the new WAF engine will be enabled with default values. We recommend upgrading your LoadMaster to use the latest WAF feature prior to upgrading to 7.2.61 so that you can configure the WAF engine to suit your configuration at the earliest possible convenience.

▼ WAF Options (Legacy)

WAF Options (Legacy) will be fully deprecated as part of the v7.2.61 release.

Deprecated means that we intend to fully remove WAF Options (Legacy) from the LoadMaster. If you are running WAF Options (Legacy) and upgrade to the v7.2.61 release, a warning will be provided and the new WAF engine will be enabled with default values.

We recommend upgrading your LoadMaster to use the latest WAF feature prior to upgrading to 7.2.61 so that you can configure the WAF engine to suit your configuration at the earliest possible convenience.

Available Rulesets

Generic Rules

- ☒ ip_reputation
- ☐ known_vulns
- ☐ malware_detection
- ☐ botnet_attacks
- ☐ creditcard_known
- ☐ creditcard_track_pan

Application Specific

- ☐ cpanel_attacks
- ☐ drupal_attacks
- ☐ joomla_attacks
- ☐ modx_attacks
- ☐ netcat_attacks

Manage Rules

List of rules Rule Filter:

- ☒ 2200000:reputation-Malicious IP:SLR: Client IP in Blocklist.
- ☒ 2200002:REPUTATION/ANONYMIZER:SLR: Client IP in TOR Exit Nodes Blocklist.

In the **WAF Options** section of the Virtual Service modify screen (**Virtual Services > View/Modify Services > Modify**), there is a drop-down list called **Default Operation**. The **Default Operation** can be set to **Audit Only** or **Block Mode**.

The **Audit Only** mode of operation sets the **SecDefaultAction** to **phase:2,log,auditlog,pass**.

The **Block Mode** of operation sets the **SecDefaultAction** to **phase:2,log,auditlog,block,drop**.

Rule Block Function

Rule Block Function

The rule block function is quite complicated. This section offers further explanation of the rule block function. The following example has been taken from <https://github.com/Spiderlabs/ModSecurity/wiki/Reference-Manual#block> and further explanatory text has been added.

The block action is essentially a placeholder that is intended to be used by rule writes to request a blocking action, but without specifying how the blocking is to be done. The **secDefaultAction** command specifies how the blocking is to be done. The block action is a placeholder that will be replaced by the action from the last **secDefaultAction** in the same context.

Block Example 1

The following example shows the **SecDefaultAction** set to **deny**. The second rule will “deny” because the **SecDefaultAction** is set to **deny**.

```
SecDefaultAction phase:2,deny,id:101,status:403,log,auditlog
SecRule ARGS attack2 phase:2,pass,id:103
SecRule ARGS attack1 phase:2,block,id:102
```

Block Example 2

The following example shows the usage of the **SecRuleUpdateActionById** command to override how a rule handles blocking. The **SecRuleUpdateActionById** command allows a rule to be reverted back to the previous **SecDefaultAction**. In this example, the first rule (**SecRule ARGS attack1 phase:2,deny,id:1**) would deny based on meeting the successful conditions associated with the rule.

By using the **SecRuleUpdateActionById** against rule **Id 1** and indicating block, we are associating the first rule action to that of the **SecDefaultAction** which is pass. So in the case, the first rule would pass based on meeting the successful conditions associated with the rule; it would not deny.

```
SecDefaultAction phase:2,pass,log,auditlog
SecRule ARGS attack1 phase:2,deny,id:1
SecRuleUpdateActionById 1 block
```

Managing Custom WAF Rules in the LoadMaster

Managing Custom WAF Rules in the LoadMaster

Refer to the following sections for details on managing custom WAF rules in the LoadMaster.

Related Links

- [Add a Custom Rule](#)
- [Delete/Download a Custom Rule or Data File](#)

Add a Custom Rule

Follow the steps below to find out how to add custom WAF rules in the Web User Interface (WUI) of the LoadMaster:

1. In the main menu, select **Web Application Firewall > Custom Rules**.

WAF Custom Rules

Installed Rules	Installed Date	Operation
known	Tue, 24 May 2022 09:48:52	Delete Download

Ruleset File: [Choose File](#) No file chosen [Add Ruleset](#)

WAF Custom Rule Data

Installed Data Files	Installed Date	Operation
ipMatchFrom.txt	Tue, 24 May 2022 09:48:28	Delete Download
owasp_cust.data	Tue, 24 May 2022 09:48:33	Delete Download
test_blacklist.txt	Tue, 24 May 2022 09:48:38	Delete Download

Data File: [Choose File](#) No file chosen [Add Data File](#)

- To upload custom rules, click **Choose File** in the **Installed Rules** section.

Note: Individual rules can be uploaded as .conf files, or you can load a package of rules in a tar.gz file. The first character in the filename must be an alpha character or an underscore (_). The other characters in the filename can include full stops (.) or dashes (-).

Note: Rules listing IP addresses with the /32 subnet mask are not supported and will not upload successfully.

- Browse to and select the rules to be uploaded.
- Click **Add Ruleset**.
- To upload any additional data files, click **Choose File** in the **Custom Rule Data** section.

Note: The additional files are for the rules' associated data files. If using a Tarball, the rules and data files can be packaged together.

- Browse to and select the additional data files.
- Click **Add Data File**.

The rules will now be available to assign within the Virtual Services modify screen (**Virtual Services > View/Modify Services > Modify**). Refer to the [Assigning Custom Rules to a Virtual Service](#) section to find out how to configure the Virtual Service.

Delete/Download a Custom Rule or Data File

Delete/Download a Custom Rule or Data File

Installed Rules	Installed Date	Operation
modsecurity_crs_20_protocol_violations	Wed, 02 Sep 2015 09:11:56	Delete Download

Custom rules and data files can be deleted or downloaded by clicking the relevant buttons.

Note: If a rule is assigned to a Virtual Service, it will not be available for deletion.

Assigning Custom Rules to a Virtual Service

Assigning Custom Rules to a Virtual Service

Before you can assign a custom rule to a Virtual Service, the rule must first be installed on the LoadMaster. Refer to the [Add a Custom Rule](#) section for instructions on how to do this.

Custom rules can be assigned as needed to each individual Virtual Service. Follow the steps below to assign a custom rule to a Virtual Service:

1. In the main menu of the LoadMaster WUI, select **Virtual Services > View/Modify Services**.

Virtual IP Address	Prot	Name Layer	Certificate Installed	Status	Real Servers	Operation
10.35.48.30:80	tcp	L7+WAF		● Up		Modify Delete

2. Click **Modify** on the relevant Virtual Service.
3. Expand the **WAF** section.

The screenshot displays the WAF configuration page. At the top, the 'WAF' tab is selected. Below it, the 'OWASP Core Rule Set WAF' is set to 'Enabled' with a message '1 out of 4 WAF VSs already configured'. The 'Audit mode' is set to 'No Audit' and the 'Anomaly Scoring Threshold' is '100'. The 'Paranoia Level' is 'Blocking at Level 1'. The 'Manage Rules' section is expanded, showing a list of rules: 'application-attack-session-fixation', 'application-attack-java', 'Custom Rules' (with 'known' and 'owaspcust' checked), and 'Workloads' (with 'drupal', 'wordpress', 'nextcloud', 'dokuwiki', and 'cpanel' unchecked). There are 'Clear All' and 'Set All' buttons above the list, and a 'Rule Filter' text box. To the right of the list are 'Apply' and 'Reset' buttons. Below the 'Manage Rules' section, the 'Hourly Alert Notification Threshold' is '0' with a 'Set Alert Threshold' button. There is an 'Enable IP Reputation Blocking' checkbox and a link 'Click here to perform False Positive Analysis'. At the bottom right is an 'Advanced Settings' button.

4. Select **Enabled**.

Note: A message is displayed next to the **Enabled** check box displaying how many WAF-enabled Virtual Services exist and it also displays the maximum number of WAF-enabled Virtual Services that can exist. If the maximum number of WAF-enabled Virtual Services has been reached, the **Enabled** check box becomes greyed out.

5. Assign Custom Rules by selecting them in the **Manage Rules** section.

6. To enable/disable the individual rules per ruleset, select/unselect the relevant check boxes. Rules can be filtered by entering a filter term in the **Rule Filter** text box. When you have a filter entered, you can do the following:
- Click **Clear All** to disable all rules for the selected ruleset.
 - Click **Set All** to enable all rules for the selected ruleset.
 - Click **Reset** to disable all rules and rulesets.

Note: There is a **Run First** check box available for custom rules. If the **Run First** check box is enabled for a custom rule, the rule will be run first, before the OWASP Core Rule Set (CRS). If the **Run First** check box is disabled for a custom rule, the custom rule runs after the CRS. The **Run First** check box is disabled by default.

7. When finished selecting the relevant rulesets and rules, click **Apply**.

- [WAF Misconfigured State](#)

WAF Misconfigured State

WAF Misconfigured State

Status

● WAF Misconfigured

On the **View/Modify Services** screen in the LoadMaster WUI, the **Status** of each Virtual Service is displayed. If the WAF for a particular Virtual Service is misconfigured, for example if there is an issue with a rule file, the status changes to **WAF Misconfigured** and turns to red. If the Virtual Service is in this state, all traffic is blocked. WAF can be disabled for that Virtual Service to stop the traffic being blocked, if required, while troubleshooting the problem.

Backing Up and Restoring WAF Configuration

Backing Up and Restoring WAF Configuration

Restore Backup

Backup File	<input type="button" value="Choose File"/>	No file chosen
LoadMaster Base Configuration	<input checked="" type="checkbox"/>	
VS Configuration	<input checked="" type="checkbox"/>	
Geo Configuration	<input type="checkbox"/>	
ESP SSO Configuration	<input type="checkbox"/>	
<input type="button" value="Restore Configuration"/>		

A backup of the LoadMaster configuration can be taken by going to **System Administration > Backup/Restore** and clicking **Create Backup File**.

The configuration can be restored from this screen also. Please keep in mind that the Virtual Service settings can be restored by selecting **VS Configuration** and the rules can be restored by selecting **LoadMaster Base Configuration**.

Note: A WAF configuration can only be restored onto a LoadMaster with an WAF license.
